The fables of Æsop are *fictions* of the simplest kind, but yet such as required a peculiarly lively fancy and inventive genius to produce. The *fabrication* of a play, as the production of Shakespeare's pen, was once executed with sufficient skill to impose for a time upon the public credulity . . . In an extended sense of the word *fiction*, it approaches still nearer to the sense of *fabricate*, when said of the *fictions* of the ancients, which were delivered as truth, although admitted now to be false: the motive of the narrator is what here constitutes the difference—namely, that in the former case he believes what he relates to be true, in the latter he knows it to be false. The heathen mythology consists principally of the *fictions* of the poets; newspapers commonly abound in *fabrications*." (*Crabb: Eng. Synon.*)

"When a chieftain designed to summon his clan upon any sudden or important emergency, he slew a goat and, making a cross of any light wood, seared its extremities in the fire, and extinguished them in the blood of the animal. This was called the *Fiery-cross*, also *Croix Tarigh*, or the Cross of Shame, because disobedience to what the symbol implied inferred infamy. It was delivered to a swift and trusty messenger, who ran full speed with it to the next hamlet, where he presented it to the principal person, with a single word, implying the place of rendezvous. He who received the symbol was bound to send it forward, with equal despatch, to the next village, and thus it passed with incredible celerity through all the district which owed allegiance to the chief, and also among his allies and neighbors, if the danger was common to them. At sight of the *Fiery-cross*, every man, from sixteen years old to sixty, capable of bearing arms, was obliged instantly to repair, in his best arms and accoutrements, to the place of rendezvous. He who failed to appear, suffered the extremities of fire and sword, which were emblematically denounced to the disobedient by the bloody and burnt marks upon the warlike signal."

2. *Bot.:* That part of the stamen which supports the anther. The filament, when structurally considered, is found to consist of a thin epidermis, on which occasionally stomata and hairs occur, and of a layer of cellular tissue inclosing a bundle of spiral vessels, which traverses its whole length, and terminates at the union between the filament and the anther. The filaments of *Callitriche verna* are said to have no vessels. The filament is usually, as its name imports, filiform or thread-like, cylindrical, or slightly tapering toward its summit. It is often, however, thickened, compressed, and flattened in various ways. It sometimes assumes the appearance of a petal, or becomes petaloid; occasionally it is subulate or slightly broadened at the base, and drawn out into a point like an awl, and at other times it is clavate, or narrow below and broad above.

The filament varies much in length and in fineness. The length bears a relation to that of the pistil, and to the position of the flower, whether erect or drooping; the object being to bring the anther into more or less immediate contact with the upper part of the pistil, so as to allow the pollen to be scattered on it. The filament is usually of sufficient solidity to support the anther in an erect position; but sometimes, as in Grasses, Littorella, and Plantago, it is very delicate and capillary or hair-like, so that the anther is pendulous. The filament is usually continuous from one end to the other, but in some cases it is bent or jointed. (Bal-four.)

3. To *find* fault with: To blame, to censure, to object to.

4. To *find* in: To provide with; as, to *find* a person in clothes, board, and lodging, &c.

¶ (1) Crabb thus discriminates between *to find* fault with, *to blame*, and *to object* to: "To *find* fault with signifies to point out a fault either in some person or thing; to *blame* is said only of the person; *object* is applied to the thing only; we *find* fault with a person for his behavior; we *find* fault with our seat, our conveyance, and the like; we *blame* a person for his temerity or his improvidence; we *object* to a measure that is proposed; we *find* fault with or *blame* that which has been done; we *object* to that which is to be done."

(2) He thus discriminates between *to find*, *to find out*, *to discover*, *to espy*, and *to descry*: "To *find* signifies simply to come within sight of a thing, which is the general idea attached to all these terms; they vary, however, either in the mode of the action or in the object. What we *find* may become visible to us by accident, but what we *find* out is the result of an effort. We may *find* anything as we pass along in the streets; but we *find* out mistakes in an account by carefully going over it, or we *find* out the difficulties which we meet with in learning, by redoubling our diligence. What is *found* may have been lost to ourselves, but is visible to others. What is *discovered* is always remote and unknown, and when *discovered* is something new. A piece of money may be *found* lying on the ground; but a mine is *discovered* underground. What has once been *discovered* cannot be *discovered* again; but what is *found* may be many times *found*. *Find* out and *discover* differ principally in the application; the former being applied to familiar, and the latter to scientific objects; scholars *find* out what they have to learn; men of research *discover* what escapes the notice of others. To *espy* is a species of *finding* out, namely, to *find* out what is very secluded or retired; and *descry* is a species of *discovering*, or observing at a distance, or among a number of objects."

(3) He thus discriminates between *to find*, *to discover*, and *to invent*: "To *find* or *find* out is said of things which do not exist in the forms in which a person *finds* them; to *discover* is said of that which exists in an entire state; *invent* is said of that which is new made or modeled. The merit of *finding* or *inventing* consists in newly applying or modifying the materials, which exist separately; the merit of *discovering* consists in removing the obstacles which prevent us from knowing the real nature of the thing; imagination and industry are requisite for *finding* or *inventing*; acuteness and penetration for *discovering*. A person *finds* reasons for justifying himself; he *discovers* traits of a bad disposition in another. Cultivated minds *find* sources of amusement within themselves, or a prisoner *finds* means of escape. Many traces of a universal deluge have been *discovered*: the physician *discovers* the nature of a particular disorder. *Find* is applicable to the operative arts; *invent* to the mechanical; *discover* to the speculative. We speak of *finding* modes for performing actions, and effecting purposes; of *inventing* machines, instruments, and various matters of use or elegance; of *discovering* the operations and laws of nature. Thus the astronomer *discovers* the motions of the heavenly bodies, by means of the telescope which has been *invented*." (*Crabb: Eng. Synon.*)

¶ (1) Crabb thus discriminates between *fine*, *delicate*, and *nice*: "*Fine*, in the natural sense, denotes smallness in general. *Delicate* denotes a degree of *fineness* that is agreeable to the taste. Thread is said to be *fine* as opposed to the coarse and thick; silk is said to be *delicate*, when to *fineness* of texture it adds softness. The texture of a spider's web is remarkable for its *fineness*; that of the ermine's fur is remarkable for its *delicacy*. In their moral application these terms admit of the same distinction: the *fine* approaches either to the strong or to the weak; the *delicate* is a high degree of the *fine*, as a *fine* thought, which may be lofty, or *fine* feeling, which is acute and tender, and delicate feeling which exceeds the former in *fineness*. *Delicate* is said of that which is agreeable to the sense and the taste; *nice* to what is agreeable to the appetite: the former is a term of refinement; the latter of epicurism and sensual indulgence. The *delicate* affords pleasure only to those whose thoughts and desires are purified from what is gross; the *nice* affords pleasure to the young, the ignorant, and the sensual: thus *delicate* food, delicate colors, delicate shapes and forms are always acceptable to the cultivated; a meal, a show, a color and the like will be *nice* to a child, which suits its appetite, or meets its fancy. . . . A person may be said to have a *delicate* ear in music whose ear is offended with the smallest discordance; he may be said to have a *nice* taste or judgment in music who scientifically discriminates the beauties and defects of different pieces. A person is *delicate* in his choice who is guided by taste and feeling; he is *nice* in his choice, who adheres to a strict rule. A point in question may be either *nice* or *delicate*: it is *delicate* as it is lightly to touch the tender feelings of any party; it is *nice* as it involves contrary interests, and becomes difficult of determination." (*Crabb: Eng. Synon.*)

The violation of a rule or law is attended with a *fine* or *mulct*, but the former is a term of general use; the latter is rather a technical term in law; a criminal offense incurs a *penalty*; negligence of duty occasions the *forfeiture*." ¶ Crabb thus discriminates between *fire*, *heat*, *warmth*, and *glow*: "*Fire* is with regard to *heat* as the cause to the effect. *Fire* is perceptible to us by the eye, as well as the touch; *heat* is perceptible only by the touch. *Fire* has within itself the power of communicating *heat* to other bodies at a distance from it; but *heat*, when it lies in bodies without *fire*, is not communicable or even perceptible, except by coming in contact with the body. *Fire* is producible in some bodies at pleasure, and when in action will communicate itself without any external influence; but *heat* is always to be produced and kept in being by some external agency: *fire* spreads, but *heat* dies away. *Fire* is producible in certain bodies; but *heat* may be produced in many more bodies: *fire* may be elicited from a flint, or from wood, steel, and some few other materials; but *heat* is producible, or exists to a greater or less degree, in all material substances. *Heat* and *warmth* differ principally in degree; the latter being a gentle degree of the former. *Heat* is less active than *fire*, and more active than *warmth*: the former is produced in bodies, either by the violent action of *fire* or the violent friction of two hard bodies; the latter is produced by the simple expulsion of the cold. *Glow* is a partial *heat* or *warmth* which exists, or is known to exist, mostly in the human frame; it is commonly produced in the body when it is in its most vigorous state, and its nerves are firmly braced by the cold." fire-making, s.

Anthrop.: The art of producing fire. It was believed by the ancients that man was without fire till Prometheus stole some from the chariot of the sun, but the whole story has a mythic look. Plutarch says that in his time there were fireless races of mankind, and the geographer Pomponius Mela indicates Ethiopia as the locality of one of these. A certain Eudoxus, however, taught them how to produce it. This story cannot be tested now, but Mr. Edward Tylor, F.R.S., after passing in review the alleged modern instances of fireless races, rejects them one and all. He believes that there was a time when man was without fire, but it now everywhere appears to have passed away. The oldest method known of making fire is the South Sea Island one by means of a stick and a groove (q. v.). By a change in the way of working, this became the fire-drill (q. v.). There followed next, it is believed, the method of striking fire by means of a flint, a piece of iron pyrites and tinder. This process was known to the ancients, which is the reason why they called one of the two minerals used pyrites—i. e., firestone. The Greeks, in the time of Aristophanes, knew how to concentrate the sun's rays by a burning-glass, and the Romans in the age of Pliny (A. D. 23-79), effected the same result by concave mirrors. In the case of the need-fire, a superstitious rite connected with Sun worship, and of which an instance occurred near Perth as late as 1826, fire was obtained by the revolution of a windlass in the hole of an oaken post smeared with tar. [NEED-FIRE.] The preceding generation remembered the time when fire was obtained by flint, steel, and a tinder-box, till superseded by the lucifer matches now in use. (*Tylor: Early Hist. of Mankind*, ch. ix.) [FIRE-DRILL, STICK-AND-GROOVE.]

fire-proof, v. t. To make incombustible or proof against fire.

fire-proof, a. Proof against fire; incombustible. Buildings are rendered fire-proof by constructing them entirely of brick or stone, and using iron doors, lintels, &c., and stone stairs. Wood can be treated with silicate of soda, which, on the application of strong heat, fuses into a kind of glass, forming a shield against fire. Cloth or wood impregnated with certain saline substances will not blaze. Borax, alum, and phosphate of soda or ammonia are recommended as most suitable for this purpose. By treating cloth with graphite in a bath in which the mineral is suspended, and then subjecting it to the action of the electro-metallic bath, the cloth may be coated with metal. Woolen and ordinary stuffs may be treated with borax, alum, or soluble glass, but these cannot well be applied to the lighter descriptions, which are most liable to take fire. A weak solution of chloride of zinc has long been employed by figurantes to render their dresses incombustible.

Fire-proof building: The term is somewhat loosely applied, and may be held to mean: (1) A building absolutely incombustible, such as one whose walls, floors, and roofs are of metal, stone, brick, or cement. (2) A building capable of opposing the access of fire from without, having walls, window-shutters, and roofs which are incombustible from external flame and heat.

Fire-proof safe: A safe for the protection of valuables in case of the burning of a building in which they are placed.

Fire-proof structure: A vault, safe, or building proof against destruction by fire, either from the outside or by the burning of its contents. The provision against outside fire is the usual object, but in fire-proof structures the internal floors or partitions must also be impervious to fire, to make the building technically fire-proof.

fire-worm, s. A glow-worm (q. v.).**Fire-worship, s.**

Religious: The worship or veneration of fire, a very old and very widely extended form of faith. The real and absolute worship of fire exists in two forms, the first belonging to fetishism and the second to polytheism. In the former the rude barbarian adores the actual flame as if it was the highest object he could adore; in the latter he regards any individual fire as a manifestation of one great elemental being—the Fire-god (q. v.). It seems to have existed among the American Indians, the Asiatics and Turanians generally, the Assyrians, Chaldeans, Phœnicians, and other Syro-Arabbians, and finally among the Aryans. Among the last-named race, the Vedic Hindoos worshiped Agni, Fire (cf. Lat. *ignis*, which is essentially the same word). The first word of the first Vedic hymn is his name in an oblique case, Agnim. The first sentiment is "Agni, I entreat, divine appointed priest of sacrifice." [For Persian Fire-worship see FIRE-WORSHIPERS.] The classical religions bring prominently into view the special deities of Fire: Among the Greeks, Hephaistos (Vulcan), and the virgin goddess Hestia, the divine hearth, who was worshiped by the Romans under the name of Vesta, and whose sacred fire was tended incessantly in her temple in the Forum by the vestal virgins. One great branch of Fire-worship was Sun-worship (q. v.).

Fire-worshippers, s. pl.

Religious: The Zoroastrians, called also Guebres. Herodotus, about 450 B. C., said "the Persians think fire to be a god." Strabo, about 50 A. D., says "They peculiarly sacrifice to fire and water, placing dry wood on the fire strip of its bark, with fat thrown upon it." The Rev. Dr. Wilson, of Bombay, alleges that "they actually address it in supplication, as if it were sentient, intelligent, divine, and omnipresent, and ready to hear, bless, assist, and deliver; as is clearly proved by many passages of the Vandidad and by several of the Yasts and Has of the Yacna and Niashes, to be found in the works esteemed sacred, and used by the Parsis [Parsees] in their daily prayers" (Wilson: *Sermon to the Parsis*, 3d ed. (1847), pp. 60, 61). No prominent

race now in India has become more rapidly modified by intercourse with Europeans, and Prof. Max Müller believes that the so-called Fire-worshippers do not worship the fire, but regard it like other great material phenomena, as an emblem of the Divine power. This, as Tylor states, is probably now true of the intelligent Parsees; how far it is so of those less enlightened remains to be ascertained. The Fire-worshippers have, in the course of their history, suffered the most cruel persecution from the Mohammedans, and the leading features of the picture drawn of this in the part of Moore's *Lalla Rookh* called the *Fire-worshippers*, is true to history.

fi're-brick, s. [Eng. *fire*, and *brick*.] A brick of refractory clay for lining furnaces, ovens, and for all kinds of brickwork exposed to such an intense heat as would melt common bricks. Firebricks are made from a natural compound of silica and alumina, which, when free from lime and other fluxes, is infusible under the greatest heat to which it can be subjected. Oxide of iron, however, which is present in most clays, renders the clay fusible when the silica and alumina are nearly in equal proportions, and those fire-clays are the best in which the silica is greatly in excess over the alumina. In making bricks and refractory goods, it is usual to use about two-thirds of fire-clay and one-third of burnt clay or bricks, to stiffen the mass and prevent undue combustion. (Weale.)

fi're-cláy, s. [Eng. *fire*, and *clay*.] A kind of clay consisting of nearly pure silicate of alumina, capable of standing intense heat, and therefore used in the manufacture of fire-bricks (q. v.). Fire-clay is found throughout the coal formation. The mass is crushed between iron rollers; it softens by exposure to the atmosphere, but some of it is too hard for making into bricks. The powder thus obtained is mixed with a small portion of lime when that substance is not previously contained in it, and sufficient water to make it cohere slightly by pressure. (Weale.)

II. Technically:

1. *Zool.* (pl. *fishes*; *Lat. Pisces*): The fifth and last class of vertebrate animals. Like Reptiles and Amphibians, they have cold red blood; but, unlike them, they are normally fitted for a permanently aquatic life by being provided with branchiæ or gills which do not pass away. The covering is of scales. Propulsion is by fins, into which the four limbs of the more typical vertebrates are transformed. [*FIN*.] The skeleton varies greatly in the degree of its consolidation. Most modern fishes have it bony; but some well-known families, notably the Sharks and Rays, have it cartilaginous, while in the highly aberrant Lancelet (*Amphioxus*) it almost disappears. In all fishes but the last-named genus there is a heart, which as a rule has but one auricle and one ventricle. The forms of the several genera vary, the normal one approaching what is mathematically called the solid of least resistance. The sexes are distinct. Propagation is by means of ova, and fishes are prolific beyond all conception. About 8,000 species are known. Linnaeus had a class Pisces, but he excluded from it various genuine fish-genera: *Squalus*, *Raia*, *Ostracion*, *Diodon*, &c., calling them *Amphibia nantes*. (*Linnaeus: Systema Natura*, 3d ed., 1767.) Cuvier divided them into two series, (1) Fish properly so called, Common Fish (*i. e.*, Osseous Fishes), and (2) Chondropterygii or Cartilaginous Fishes. The first are divided into the orders Plectognathi, Lophobranchii, Malacopterygii, and Acanthopterygii (q. v.). (*Griffith: Cuvier*, 1834, pp. 6, 7, 8.) For the classification of Agassiz, see 2 *Palæont.* Prof. Owen, slightly modifying the classification of Prof. J. Müller, divides the class into the eleven following orders: Dermopteri, Malacopteri, Pharyngognathi, Anacanthini, Acanthopteri, Plectognathi, Lophobranchii, Ganoidei, Protopteri, Halocephali, and Plagiostomi. (*Owen: Compar. Anat. Invertebr. Anim.*, 1846, pp. 47-51.) Prof. Huxley divides them into the six following orders: Dipnoi, Elasmobranchii, Ganoidei, Teleostei, Marsipobranchii, and Pharyngobranchii.

2. *Palæont.*: Fishes being the lowest vertebrates in organization peem, as might have been expected, to have been the first of that kingdom brought into being; they appear in the Upper Silurian rocks, and are found in every marine formation since deposited. Teeth, the spines called ichthyodolurites, scales, and even the whole external framework occur in various formations. To meet the necessities of the paleontologist, Louis Agassiz, about 1840, or earlier, divided fishes by their

scales alone into four orders—Cycloidei, Ctenoidei, Ganoidei, and Placoidi (q. v.). The oldest fossil-fish is generally considered a placoganoide one. It is a Pteraspis from the base of the Lower Ludlow Rocks. Ichthyodontoidea at the top of the Upper Ludlow may be of the Cestracanth family. In the Old Red Sandstone, as the readers of Hugh Miller's works know, fishes abound so much that it has been called the Age of Fishes. The oldest genera are Cephalaspis, Acanthodes, &c., from the Lower Old Red Sandstone of Scotland. In the Middle Old Red follow Pterichthys, Coccoosteus, Diplopterus, Dipterus, Asterolepis, &c., and in the Upper Holopterychius. Some are so abnormal in aspect that only an expert could tell that they were fishes at all; others so much the reverse that a child could name correctly their class. The Dipnoi, or Mud Fishes, now first appear. In the Carboniferous rocks Ganoidei are still numerous, but many Plagiostomous fishes occur. With the commencement of the Mesozoic rocks the Ganoidei lose their preponderance, and an antique pattern of tail, called the heterocercal [HETERO-CERCAL], one which had hitherto been usual, now becomes rare, its place being taken by the modern or homocercal tail [HOMOCERCAL]. In the Cretaceous period the Teleostean or Bony fishes begin, with Ctenoid or Cycloid scales. If the resemblance pointed out by Prof. Huxley between Pteraspis and Cephalaspis on the one hand, and the Teleostean Silurids on the other, are those of affinity, the regularity of this line of progressive development would be overthrown; if those of analogy only, no such consequence follows.

† The word fishery is popularly used in a comprehensive sense; not merely is there a herring-fishery, a salmon-fishery, a cod-fishery, a pilchard-fishery, &c., for catching these genuine fishes, there is a whale-fishery for harpooning the mammals called whales, a crab and lobster-fishery for catching those crustaceans, and an oyster-fishery for obtaining those testaceous mollusks, as well as a seal-fishery for capturing those animals. The great locality for the whale-fishery is the Polar regions of the Northern and Southern Hemispheres, that for the cod-fishery the banks of Newfoundland, that for the herring-fishery the entire eastern coast of this country and the coasts of Great Britain and Ireland, that for the salmon-fishery the rivers of North America and Britain. The practice of salting fish was known to the Egyptians about 1351 B. C., or even earlier. Herrings were largely caught in Scotland, as early as the ninth century. The injudicious interference of the government drove some of the fishermen to Holland. The Dutch learned from them, and have not to this day forgotten the value of the Scottish fisheries. The fisheries of this country are superintended by a national commission, and extensive hatcheries for propagation of various species with which to stock our waters have been established, and are in successful operation.

A person *fits* himself for taking orders when he is at the university, he *prepares* himself at school before he goes to the university. To *fit* is said of everything, both in a natural and a moral sense: *to qualify* is used only in a moral sense. *Fit* is employed mostly for acquirements which are gained by labor; *qualify* for those which are gained by intellectual exertion."

(2) He thus discriminates between *to fit*, *to suit*, *to adapt*, *to accommodate*, and *to adjust*: "To *fit* is to provide one's self with the requisite qualification; *to suit* is to provide the thing with the suitable or agreeable qualities: we *fit* ourselves for the thing; we *suit* the thing to ourselves. To *fit*, in the intransitive sense, is said of things in general as they respect each other; *suit* is mostly of things as they respect the moral agent. In the mechanical and literal sense, things *fit* each other; and also in the moral sense, there is a manifest *fitness* in all things which we term right and just; things, whether of a corporeal or a spiritual nature, are said to *suit* the taste of a person. To *adapt* is a species of *fitting*; *to accommodate* is a species of *suiting*; both applied to the moral actions of conscious beings. *Accommodate* and *adjust* are both applied to the affairs of men which require to be kept, or put in right order; but the former implies the keeping as well as putting in order." Shelves are *fixed*; a horse is *fastened* to a gate; bills are *stuck*."

(2) He thus discriminates between *to fix*, *to settle*, and *to establish*: "*Fix* is the general and indefinite term; *to settle* and *to establish* are to *fix* strongly. *Fix* and *settle* are applied either to material or spiritual objects; *establish* only to moral objects. To *fix* is properly the act of one; *to settle* may be the joint act of many. To *fix* and *settle* are personal acts, and the objects are mostly of a private nature; but *establish* is an indirect action, and the objects mostly of a public nature."

(3) He thus discriminates between *to fix*, *to determine*, *to settle*, and *to limit*: "These all denote the

acts of conscious agents, but differ in the object and circumstances of the action. To *fix*, in distinction from the rest, is said in regard to a single point or a line; but to *determine* is always said of one or more points, or a whole: we *fix* where a thing shall begin; but we *determine* where it shall begin, and where it shall end, which way, and how far it shall go, and the like. So in morals we may *fix* the day and hour; but we *determine* the mode of doing. *Determine* is to *settle* as a means to the end; we commonly *determine* all subordinate matters, in order to *settle* a matter finally." (Crabb: *Eng. Synon.*)

***fix-a-ble, a.** [Eng. *fix*; *-able*.] That may or can be fixed; capable of being fixed.

Some, when exposed to the air, become

fixed-star, *s.*

1. **Pyrotech.:** A composition introduced into a rocket-case and emitting fire at five holes, to represent a star. The composition is niter, sulphur, gunpowder-meal, and antimony.

2. **Astron. (pl.):** Stars which till lately were supposed absolutely to maintain their relative positions toward each other in the sky, and are still admitted to do so very nearly. They are distinguished from planets or "wandering stars." The number of fixed stars is infinitely great, especially in the part of the heavens called the Milky Way (q. v.). From a remote period of antiquity they have been grouped into constellations. [CON-
STELLATION.] They shine by their own light, and probably are suns each one surrounded by planets of its own. Huggins considered that Sirius was moving away from the sun at the rate of 29½ miles a second. Some stars are periodic, and vary in brightness, others disappear and come again. There are double and triple stars, gravity operating on their movements. Spectroscopic observation is beginning to detect simple substances like those on the earth in some fixed stars. Thus Huggins and Miller have found that the red star Aldebaran has spectroscopic lines agreeing with those of sodium, magnesium, calcium, iron and bismuth, tellurium, and mercury, and that the brilliant white star Sirius has lines corresponding with those of sodium, magnesium, hydrogen, and iron.

"To ascertain, so far as it is possible to do so, the distances of the fixed stars," it is useful to take the major axis or principal diameter of the earth's orbit, as the base line. Though six months must elapse before the observation of the parallax of the star as from one extremity of the base can be followed by an observation of its parallax as witnessed from the other, yet as it is possible to calculate exactly how far the star will have moved during the six months, the two observations can be brought into comparison. In the vast majority of instances the calculated zenith distance of the star after the lapse of the six months, and its actual zenith distance, as in due time ascertained by observation, are found precisely to agree, the base line, upward of 184 millions of miles in length, looking like a mathematical point in comparison with the infinite distance of the fixed stars. A few, however, are found to have parallax. Alpha Centauri, in the Southern hemisphere, has one of 2". No star has so great a parallax. If the observation made be correct, then its distance from us would be only about 200 times as great as that of the sun. The parallax of the bright star of Lyra is only a quarter of a second. Struve of St. Petersburg says that stars of the second magnitude have an average parallax of ½ of a second. But Professor Airy thinks the astronomical observer cannot accurately split a second into tenths. Besides this, refraction prevents observations being as accurate as Struve believes. To diminish the effect of parallax, observations are now made on two stars near each other in the heavens, the one with no parallax, and the other whose parallax we wish to ascertain. The angle between the two stars is noted twice, with an interval of six months between, and as both stars are similarly affected by refraction, precession, notation, and observation, no corrections for those sources of error require to be applied. The celebrated astronomer, Bessel of Königsberg, used this method for determining the distance of the small star No. 61 Cygni. He found the parallax to be ½ of a second, and therefore estimated its distance at 660,000 times the radius of the earth's orbit, or 63,000,000,000,000, that is sixty-three billions of miles [English notation; or sixty-three trillions by the French system]. "The term 'fixed stars,'" says Professor Airy, "is a good one for young astronomers to use; but the vast majority of the stars which have been well observed, seem to have a proper motion of their own, and that is known by the term 'proper motion.'" It is in every case a small quantity. The largest known is that of the small star, 61 Cygni, which moves nearly 3" in a year, and that of a star called Groombridge, 1830, nearly 4" in a year. The first has very decided parallax, the second probably has it too, though to a smaller amount. Sirius and Arcturus have also a perceptible proper motion.

flāg (1), *s.* [Dan. *flag*; Sw. *flagg*; Dut. *vlag*; Ger. *flagge*; from the same root as *flag* (1), *v.*]

1. An ensign or colors; a piece of cloth, either plain or colored, and having certain figures, lines, or marks painted or worked on it; a banner indicating nationality, occupation, or intelligence. Flags of nationality are standards, ensigns, pennants (pendants), jacks. Flags of occupation indicate service, as war, merchant, dispatch, pilot.

yacht-squadron, liners, &c. Flags of intelligence are of various colors and of three shapes: square, pointed, and burgee. They are used in various combinations to transmit messages according to a printed or secret code. The standard (military or naval) is a war flag. The ensign is national. The idea of standards originated with the Egyptians, at an early age. The Crusaders added the cross to their banners. The union of the three crosses of St. George, St. Andrew, and St. Patrick, marks first the union of England and Scotland, into the kingdom of Great Britain; and then, this kingdom with Ireland. This is termed the Great Union Flag of Great Britain, and was brought by the colonists to America. When the thirteen colonies began to feel the pressure of British rule, they placed upon their banners a rattlesnake, cut in thirteen pieces, representing the thirteen colonies, with the motto, "Join or die." When these colonies became more united in their purposes of resistance to British tyranny, they placed upon their flag a well-formed rattlesnake in the attitude of about to strike, with the motto, "Don't tread on me."

The next form of the United States flag was our present standard, the Stars and Stripes. On the 14th of June, 1777, the Continental Congress resolved that the flag of the United States be thirteen stripes, alternate red and white, and that the Union be thirteen white stars on a blue field, representing "a new constellation." On the 13th of January, 1794, by an act of Congress, the flag was altered to fifteen red and white stripes, and fifteen stars. On the 4th of April, 1818, Congress again altered the flag by returning to the original thirteen stripes and fifteen stars, as the adding of a new stripe for each additional state would soon make the flag too unwieldy. The new star is added to the flag on the 4th of July following the admission of each state into the Union.

Ch. Hist.: A Christian sect which arose in 1260 at Perugia, called by the French *Perouse*, and spread throughout and beyond Italy. Its adherents, who saw a plague raging, and moreover expected the world speedily to terminate, believed that they could propitiate the Divine Being by walking in procession with only a cloth tied round them, and flagellating their bare shoulders with whips, which they carried. At first they were noted for sanctity, and made many converts even from the most abandoned classes, but doubtful characters beginning to join their ranks, they fell into disrepute, and were restrained from their processions by the civil and ecclesiastical authorities, then the sect gradually died away. The terror produced by the dreadful disease called the Black Death, which destroyed many millions of people in Europe between 1348 and 1351, produced a revival of the flagellation mania, which spread over most of Europe, and was attended by greater extravagances than before. In the reign of Edward III., a band of 120 Flagellants, male and female, made their appearance in London on a missionary enterprise. They marched in procession through the streets, singing a hymn. Then they scourged each other, trusting that the spectacle might prove contagious. But the sober-minded Britons could not be induced either to flagellate themselves or submit to be flagellated by others, and the strangers had to leave the country without having made even one proselyte. In 1349, Clement VII. declared the Flagellants heretics, and took steps to repress them. In 1414 an effort was made in Thuringia to revive them anew, but the burning alive of their leader, Conrad Schmidt, and ninety of his followers in part thwarted the project, though even then the extirpation of the sect was found a work of extreme difficulty.

(a) *Ord., Lang., Bot., Manufac.*: *Linum usitatissimum*. It is an annual plant, with alternate, linear-lanceolate leaves, ovate, acuminate, ciliate, three-nerved sepals, many flowered broad cymes, with crenulate petals. Its fiber constitutes tow, which is made into yarn, and this again is woven into linen cloth. Dr. Oswald Heer of Zurich, the eminent fossil botanist, about 1783 published a paper *On the History of Flax, and its Culture in Pre-historic Times*. He shows that it has been found among the remains of the oldest pile dwellings in the Swiss Lakes, where neither hemp nor wool has been discovered. He thinks it probable that the lake-dwellers received it from the South of Europe. He alleges that it was cultivated in Egypt about 5,000 years ago. It seems to have been so also in Bible times in Palestine (Joshua ii. 6), though linen was exported from Egypt to the adjacent lands (Ezek. xxvii. 7). For the process of the manufacture, see *LINEN*. Its seeds are economically valuable. [*LINSEED*.]

2. A machine for shortening flax staple to adapt it to be worked by a given class of machines.

flax-cotton, *s.* A substance produced by a process invented by Chevalier Clausen for cottonizing flax, to render it suitable for manufacture, the objects being to expedite the processes of separating the fiber from the cellular and glutinous matters, and then reducing the fiber to a staple which can be readily treated by machinery. The flax-straw is boiled for four hours in a solution of caustic alkali in a stone vessel, by which the extraneous matters are loosened; it is then placed for two hours in a bath slightly acidulated with sulphuric acid. It is then dried and scutched to remove the cellulose. The cottonizing is performed by steeping the fiber in a bath of dilute bicarbonate of soda, and subsequently in an acidulated liquid. The action of the acid and alkali within the flax fiber generates carbonic-acid gas, and has the effect of bursting apart the fibers, which assume a cotton-like appearance. It is then bleached and spun, either mixed or otherwise.

A. As substantive:

1. Ordinary Language:

1. *Lit.*: The insect described under II. 1.

*2. *Fig.*: Anything insignificant.

"After whom is the King of Israel come out? after whom dost thou pursue? after a dead dog, after a flea!"—*1 Samuel* xxiv. 14.

II. Technically:

1. *Entom.*: A too well-known wingless insect, *Pulex irritans*. Though, as a rule, each species of *Pulex* is parasitic only upon one animal, as *Pulex canis* upon the dog, *P. talpæ* on the mole, and *P. hirundinis* on the swallow, yet *P. penetrans* is said to be an exception, and to prey on man, the dog, and the cat. If there is no confounding of species, then the presence of a dog or cat in the house can introduce fleas. The female lays in the cracks of floors or such places, a dozen of eggs, white and a little viscous. In favorable weather they hatch in five or six days, giving exit to little footless larvae, like small worms, first white, then reddish, which roll themselves in a circle or spiral, and move forward in a serpentine manner. In about twelve days they inclose themselves in a small silken shell, and become nymphs. After other twelve they come forth as perfect insects. The last brood of summer continues in the larval state all winter. The flea is encased in armor like a medieval knight. It can leap thirty times its own height; it can draw with ease eighty times its own weight. A plant [*FLEA-BANE*] has been said to destroy it. This can be done more effectually by putting a piece of fur or flannel in the haunts of the insects. In this they take refuge, and can then be detected and killed.

2. *Script.*: The rendering of the Hebrew word *parsh*; Sept. *psyllas*; *Vulg. pulex*, which is probably correct. The Hebrew word, according to Gesenius, is from an obsolete quadrilateral root, *parash*=to leap. (*Ps. xxiv. 14, xxvi. 20*.)

In the moral application, *flexible* is indefinite both in degree and application; it may be greater or less in point of degree: whereas *pliant* supposes a great degree of *pliability*; and *suppleness*, a great degree of *pliancy* or *pliability*; it applies likewise to the outward actions, to the temper, the resolution, or the principles; but *pliancy* is applied to the principles, or the conduct dependent upon those principles; *suppleness* to the outward actions and behavior only. The flyer rotates with the spindle, and their rotation gives the twist to the yarn.

SHAKESP.: *Antony and Cleopatra*, iv. 2.

II. Technically:

1. *Min.:* A crypto-crystalline variety of quartz. It is usually gray, smoke-brown, or brownish black. If derived, as it mostly is, from the cretaceous formation, the white of the chalk is still seen on its external surface. Luster subvitreous; fracture conchoidal, leaving a cutting edge.

2. *Geol. & Palæont.:* Most of the flints scattered on the surface of the ground or existing in tertiary or more recent sedimentary deposits, came originally from the cretaceous rocks, one division of which is termed Upper White Chalk with flints, this being distinguished from the Lower White Chalk without flints. Next to the Maestricht beds and Faxoe limestone [FAXOE, MAESTRICHT], the chalk with flints constitutes the highest or newest layer yet discovered of the sedimentary rocks. The flints are interstratified layers a few inches thick, these being sometimes continuous, but more frequently in separate nodules. They recur at intervals from each other of about four feet. They are thus formed: Small plants and animals when decomposing, draw to themselves the silica of the sea [SILICA], and form concretions around them of inorganic flint. The organic portion of flint pebbles consists of diatoms, seaweeds of low organization, the minute infusorial animals called polycistina, the spicules of sponges, with echinoderms, &c. They are the same as those in agate and chalk.

B. As adj.: Made or composed of flints, or in any way pertaining to flints.

flint-glass, s. [FLINTGLASS.]

***flint-heart, *flint-hearted, a.** Having an exceedingly hard or cruel heart; hard-hearted.

flint-implements, s. pl.

Geol. & Anthropol.: A generic term used for any implements of flint obtained from pleistocene or more recent deposits, each being afterward named more specifically as its exact nature becomes understood. Mr. Evans, F.R.S., &c., divides the implements into three classes—spear-heads, oval or almond-shaped flint-implements, and flint-flakes (q. v.). Such relics of early man had been found with the bones of an elephant, in 1715, in the gravel of London, England. Similar remains were exhumed at Hoxne, near Diss, in 1797, by Mr. John Frere, who described them in a paper read in 1801 before the Society of Antiquaries. About A.D. 1833 or 1834, the Rev. Mr. McEnery, a Roman Catholic priest, discovered similar ones in Kent's Hole, Torquay, in Devon, England, of which he was the first scientific explorer, and Dr. Schmerling others in the Engis, the Engihoul, and other caves near Liège, in Belgium. From about A.D. 1841, M. Boucher de Perthes, of Abbeville, collected flint-implements from the valley of the Somme, in France, publishing the result in his *Antiquités Celtiques*, in 1847. He asserted the antiquity of the

implements which, McEnery had suspected and Schmerling maintained. No attention was paid to his views till 1858, when Dr. Falconer visited him at Abbeville, just after he had become satisfied that similar relics which he had examined in connection with the scientific exploration of Brixham Cave, in Devonshire, carried back the antiquity of man to a period when the *Hycena spelæa*, the *Elephas primigenius*, the *Rhinoceros tichorinus*, &c., inhabited Britain. Mr. Prestwich, with Mr. John Evans, in June, 1858, and the former naturalist again with Mr. Flower, in 1859, examined the valley of the Somme, and procured for the views of Perthes the assent of the scientific world. Many flint-implements have been found in the south and east of England, in Bedfordshire, in Suffolk, Hampshire, Wiltshire, and in the north and northeast of London, in Essex, in Buckinghamshire, &c. The oldest ones are palæolithic, and are unpolished; the newer neolithic and are polished. The implements from the Somme are of the former kind, and are the oldest known. According to Professor Boyd Dawkins, the river-drift man inhabiting the valleys of the Somme, the Thames, &c., was older than the cave man of Brixham, Kent's Hole, and other caverns. The former lived in the middle part of the Pleistocene (Lyell's Upper Pliocene) period and inhabited Palestine, India, and this country as well as Europe. The Abbé Bourgeois has found in Miocene strata at Thenay certain split flints, some of them bearing traces of fire. He, with M. Mortillet, Dr. Hamy, MM. Quatrefages, Worsae, and Capellini, believes in a Miocene man, or man-like creature. Mr. Grant Allen thinks that the genus *Homo* began in the Miocene with a more ape-like species than that existing now.

flint-lock, s. The old-fashioned lock for firearms, in which the cock held a piece of flint, and came glancing down upon the steel cap of the pan which contained the priming. The flint-mill is a strong circular pan ten or twelve feet in diameter, having a bottom of quartz or felspar blocks, and a runner or runners of hard siliceous stone, called chert, lime in any form being inadmissible, as it forms a flux for the other material which would vitrify in the seggars or become blistered by the escape of carbonic acid.

flint-glass, s. [Eng. *flint*, and *glass*.] A species of glass made of white sand, 52; carbonate of potash, 14; oxide of lead, 33; alumina, 1; with metallic additions to neutralize color. Pure white sand free from oxide of iron is required for flint-glass, as iron imparts a green color. The articles are made by the agency of the blow-pipe, or ponty, the mold and press, and frequently by a combination of blowing and pressing. The silica for its manufacture was formerly derived from pulverized flints, and hence its name. The presence of lead gives it a peculiar property of refracting light, which causes it to be used for lenses, and it forms one of the parts in achromatic compound lenses. Flintglass fuses at a lower temperature than ordinary glass, such as crown, plate, or window glass. It has also less color, owing to the use of the alkali potash, instead

of soda, the latter imparting a greenish tinge to glass. Flintglass is softer than some other varieties, and is the kind which is cut. It is much used for tumblers and other drinking-vessels, fine table-ware, and bottles, and various articles of decorative furniture and fittings.

To flourish is to be in full possession of the powers, physical, intellectual, and incidental; an author flourishes at a certain period; an institution flourishes; literature or trade flourishes: a nation flourishes. To thrive is to carry on one's concerns to the advantage of one's circumstances; it is a term of familiar use for those who gain by positive labor: the industrious tradesman thrives. To prosper is to be already in advantageous circumstances: men prosper who accumulate wealth agreeably to their wishes and beyond their expectations." (Crabb: *Eng. Synon.*)

Chem.: $C_{16}H_{10}$. An aromatic hydrocarbon which occurs in the last portion of the solid hydrocarbon distillate from coal tar along with Pyrene, $C_{16}H_{10}$, and Chrysene, $C_{18}H_{12}$. They can be separated by converting them into picric compounds, by melting them and gradually adding picric acid, or by dissolving them in alcohol. Chrysene is only slightly soluble, and mixing the solution with an alcoholic solution of picric acid, $C_6H_3(NO_2)_3(OH)$, the fluoranthene remains in the mother liquid and allows the mixed solution to crystallize. The picrates are decomposed by ammonia. Fluoranthene crystallizes out of alcohol in needles, which melt at 109°. The compounds which are formed with picric acid, $C_{16}H_{10}C_6H_3(NO_2)_3(OH)$, crystallize in orange needles which melt at 182°.

Obtained by heating five parts of phthalic anhydride with seven parts of resorcinol to 200°, till it forms a solid mass, which is boiled with water, the undissolved part washed with alcohol, then dissolved in dilute caustic soda, precipitated by dilute sulphuric acid and extracted with ether. It is crystallized from alcohol as a red powder, which is decomposed at 280°. It forms an orange solution in alcohol, which, when diluted with water, gives a green fluorescence. Its soda solution, when dilute, shows a beautiful yellow-green fluorescence. When dissolved in acetic acid, fluorescein is converted by bromine into Eosin (q. v.). By the action of zinc dust on its soda solution, it is reduced to fluorescein.

flū-or-ēs'-cīn, *s.* [English *fluorescence*]; *-in*. (Chem.)]

flū-or-hy'-drīc, *a.* [Eng. *fluorine*]; *hydr(o)gen*]; *-ic*.] See the compound.

fluorhydric-acid, *s.*

Chem.: Hydrofluoric acid, hydrogen fluoride, fluoride of hydrogen, hydric fluoride, HF. The anhydrous acid is obtained by neutralizing in a platinum dish the aqueous solution of hydrofluoric acid with caustic potash, and evaporating the solution. The salt, KF, crystallizes in cubes; when dissolved in water and evaporated quadratic tables of an acid, fluoride KF·HF, crystallize out; these, when perfectly dry, are heated to redness in a platinum tube, and decomposed into KFHF=KF+HF. The anhydrous HF is an extremely dangerous substance; its vapor is very poisonous, and produces painful sores when it comes in contact with the skin. It is a colorless liquid which boils at 194°. If free from moisture it does not attack glass. Its vapor density is ten, that of hydrogen being one, showing that it contains one volume of fluorine and one volume of hydrogen in two volumes of hydrofluoric acid. It chars organic matter, and explodes when mixed with turpentine. It has a very great affinity for water, combining with a hissing noise. The hydrated acid is prepared by acting on fluor spar, CaF₂, with concentrated sulphuric acid in lead or platinum vessels. It is heated, and the vapor condensed by a freezing mixture, or, if required dilute, is passed into water. It dissolves most metals except platinum, gold, silver, and lead. It can be kept in gutta percha bottles. It attacks silicates and etches glass. It is detected by powdering the mineral, and placing it in a small lead dish, and adding concentrated sulphuric acid; the vessel is then covered with a plate of glass, which is coated with wax on the under side, on which letters are written by removing some of the wax. On heating the vessel the hydrofluoric acid is liberated, and attacks the glass where the wax has been removed.

flū-ōr'-īc, *a.* [Eng., &c., *fluorine*], and suff. *-ic*. (Chem.)]

Chem.: Containing more or less of fluorine, chiefly in the compound Hydrofluoric-acid.

flū-or-ide, *s.* [Eng. *fluorine*]; *-ide*.]

Chem.: A compound of fluorine with an element or radical. Fluorides give no precipitate with argentic nitrate, as argentic fluoride is soluble in water.

¶ The following are the principal *Fluorides*: *Fluoride of Ammonium*, NH₄F. Obtained by saturating hydrofluoric acid with ammonia, and allowing the solution to evaporate over quicklime. It forms hexagonal laminae, and crystallizes also with one molecule of HF, forming rhombic crystals of NH₄F·HF. *Fluoride of Calcium*: Fluorspar, CaF₂, occurs in the bones and teeth of animals in small quantities. *Fluoride of Boron*, BF₃, is a gas. *Fluoride of Silicon*, SiF₄, is a heavy, colorless, fuming gas, obtained by heating a mixture of fluor spar and sand with concentrated sulphuric acid. It is absorbed by water, forming silicofluoric acid, H₂SiF₆, and gelatinous silica is deposited, the tube should dip into mercury to prevent it being blocked up. Fluorides are decomposed by chlorine, and converted into chlorides. Soluble fluorides give a gelatinous precipitate with calcium chloride. Many double fluorides have been prepared.

flū-or-in, **flū-or-ine**, *s.* [Eng. *fluor*]; *-in*, *-ine* (Chem.) (q. v.)]

Chem.: Symbol F, at wt. 19. Fluorine occurs in Fluorspar, CaF₂; in cryolite, 6NaF·Al₂F₆, and in topaz and apatite. It has been detected in the bones, teeth, blood, and milk. It has not been isolated. A gas was obtained by the action of iodine on silver fluoride, AgF, but it was probably an iodide of fluorine. Fluorine in a free state

combines readily with silicon and metals, therefore it attacks the tube in which the experiment is performed; it decomposes water, forming hydrofluoric acid, HF. Experiments with the action of chlorine on AgF in tubes made of CaF₂, yielded HF, as the silver fluoride could not be sufficiently dried. Fluorine does not combine with oxygen.

fōg (1), s. [*Dan. (snee) fog=a snowstorm, from fyge=to drift; Icel. fok=spray; fjúk=a snowstorm.*]

1. *Lit.*: A very thick mist; small hollow vesicles of water suspended in the air, but so low as to be but a short distance from the earth in place of rising high above it and becoming so illuminated by the sun as to constitute clouds of varied hue. Fogs often arise when the air above warm, moist soil is colder than the soil itself. The hot vapors from the ground are then condensed by coming in contact with the colder air above, as the warm steam of a kettle is by the comparatively cold air of a room. But no fog arises till the cold air has absorbed vapor enough to bring it to the point of saturation. Fogs often hang over rivers. Their cause is the condensation, by contact with the cold water, of the vapor in a hot and moist air current passing over the river. The "pea-soup" fogs of Chicago life are produced by the carbon of the smoky atmosphere coloring the fog vesicles; a fog which is brown in Chicago's business district is generally white a few miles off, and wanting altogether at the further extremities of the city. On hills and mountains of any size it is easy to rise above a fog, and see it like an ocean beneath one's feet.

Feudal law: The land of the folk or people, as distinguished from book-land, or land held by charter or deed. It was held by no assurance in writing, but distributed among the common folk at the pleasure of the lord, and resumed at his discretion. It could not be devised by will.

"Now, with regard to the *folkland*, this was a species of tenure neither strictly feudal, Norman, nor Saxon; but mixed and compounded of them all; and which also, on account of the heriots that usually attend it, may seem to have something Danish in its composition. Under the Saxon government there were a sort of people in a condition of downright servitude, belonging to the lord of the soil, like the rest of the cattle or stock upon it. These seem to have been those who held what was called the *folkland*, from which they were removable at the lord's pleasure."—*Blackstone: Comment*, bk. ii, ch. 4.

folk-löre (folk as fök), s. [Eng. *folk*, and *lore*.]

Popular superstitions, tales, traditions, or legends.

Of late years the importance of the study of folk-lore has met with increasing recognition from students of anthropology and of comparative religion.

It is worthy of note that many myths are found in a somewhat similar form among peoples widely divergent in race and locality. By some writers this fact is claimed in support of the Mosaic cosmogony; while others see in it a strong proof in favor of the theory of Evolution, and a means of tracing the steps by which man has advanced to his present position. The term *Folklore* was first introduced by Mr. W. J. Thom in A. D. 1846.

"Modern *folklore* holds either that a knocking or rumbling on the floor is an omen of a death about to happen; that dying persons themselves announce their dissolution to their friends in such strange sounds."—*Tylor: Primitive Culture* (1873), l. 145.

¶ (1) **To follow on:**

(2) **To follow suit:**

Cards: To play a card of the same suit as that first played; hence, generally, to follow the same line or course of action as that taken by a predecessor.

¶ (1) Crabb thus discriminates between *to follow*, *to succeed*, and *to ensue*: “*Follow and succeed are said of persons and things; ensue of things only;*

follow denotes the going in order, in a trace or line; *succeed* denotes the going or being in the same place immediately after another: many persons may follow each other at the same time; but only one individual properly succeeds another. *To follow* in relation to things is said either simply of the order in which they go, or of such as go by a connection between them; *to succeed* implies simply to take the place after another; *to ensue* is to follow by a necessary connection.”

(2) He thus discriminates between *to follow* and *to pursue*: “*The idea of going after anything in order to reach or obtain it is common in these terms, but under different circumstances: one follows a person mostly with a friendly intention; one pursues with a hostile intention. In application to things, follow is taken more in the passive, and pursue more in the active sense: a man follows the plan of another, and pursues his own plan; he follows his inclinations, and pursues an object.*”

(3) He thus discriminates between *to follow* and *to imitate*: “*Both these terms denote the regulating of our actions by something that offers itself to us, or is set before us; but we follow that which is either internal or external; we imitate that only which is external. To follow and to imitate may both be applied to that which is good or bad: the former to all the actions, but the latter only to the behavior or the external manners.*” (*Crabb: Eng. Synon.*)

¶ Crabb thus discriminates between *follower*, *adherent*, and *partisan*: “*A follower is one who follows a person generally; an adherent is one who adheres to his cause; a partisan is the follower of a party; the follower follows either the person, interests, or the principles of any one; thus the retinue of a nobleman, or the friends of a statesman, or the friends of any man's opinions, may be styled his followers; but the adherent is that kind of follower who espouses the interests of another: a follower follows near or at a distance; but the adherent is always near at hand; the partisan hangs on or keeps at a certain distance.*” (*Crabb: Eng. 2. The vessel which contains the water for the purposes of baptism. The font is the only relic of our ancient architecture which in its form is at all analogous to the Grecian and Roman vases. The shape which has at different periods been given to it is a subject of some interest. Norman fonts are generally square or circular; the first frequently placed on five legs; but which may be the older form, the square or circle, is not yet known. The circular form continued to be much used during the Early English period; so, occasionally, was the square. Throughout the continuance of the Decorated style, the octagon was generally employed, sometimes the hexagon. During the Perpendicular style, the octagon was almost always used. Until the Reformation, and occasionally after, dipping was practiced in England. Pouring or sprinkling was not unusual previous to the Reformation; for as early as the year 754, pouring, in cases of necessity, was declared by Pope Stephen III. to be lawful; and in the year 1311, the Council of Ravenna declared dipping or sprinkling indifferent; yet dipping appears to have been in England the more usual mode. Fonts were required to be covered and locked; originally their covers were simply flat, movable lids, but they were subsequently very highly ornamented, assuming the form of spires, and enriched with various decorations in carved wood, taking the form of pinnacles, buttresses, &c.

fōnt-tē-vraud, *fōnt-tē-vrault* (*aud*, *ault*, as *ō*), s. [*Fr.* from *Lat. fontis* *Ebraldi*, so named from the place where the first monastery of the sect was erected on the confines of Angers and Tours.]

Ch. Hist.: A branch of the Benedictine order of monks which was instituted in the twelfth century by Robert of Abriessell, who brought monks and nuns under one roof, and placed them under the government of a female, because Jesus placed John in subjection to the Virgin Mary, saying, "Woman, behold thy son" (John xix. 26). The founder of the monastery was suspected of immorality, a charge which his followers strenuously denied. In 1106 the order received the sanction of Pope Pascal II.; in 1113 it was exempted from episcopal jurisdiction. In 1117 some monks connected with it came over to England by invitation of Henry II. It was remodelled in 1507 by the Abbess Renée of Bourbon.

(2) That which is fed, nourished, or brought up; a child.

"Wher that he sat or stode

She biheld opon that frely fode."

Amis and Amiloun, 715.

II. *Technically*:

1. *Phys.*: Any substance which, taken into the body, is capable of sustaining or nourishing, or which assists in sustaining or nourishing the living

being. Foods may be classed under three heads, gaseous, liquid, and solid, the first two consisting of the air we breathe—the oxygen of which is so essential to life—and the water we drink. Milk, tea, coffee, cocoa, &c., are popularly called liquid foods, but each of these is simply water in which various solid substances are dissolved, or held in suspension. The solid foods are of three kinds—viz., nitrogenous, non-nitrogenous, and mineral. Nitrogen compounds, or flesh-formers, are essentially composed of carbon, hydrogen, oxygen, and nitrogen. They possess the only ingredients capable of building up and repairing the nitrogenous tissues of the body. They also furnish a limited supply of heat, especially when heat-giving compounds are deficient in the body. Nitrogenous compounds are found both in the animal and vegetable kingdoms under the forms of albumen, fibrin, casein, gelatine, and chondrin. Non-nitrogenous compounds, or heat-givers, sometimes called carbonaceous compounds, are composed of carbon, hydrogen, and oxygen. They serve to keep up the heat of the body, and so produce energy or force. The chief heat-givers are starch, so abundant in the cereal grains, sugar, and fat. None of these substances will of itself sustain life. The mineral foods are the salts of soda and potash, the phosphates of lime and magnesia, iron, &c. Common salt is the only mineral substance purposely added to food, the other mineral substances being found in nearly all parts of plants and animals used as food. As the daily waste of the body must be met by a daily supply of nourishment, it becomes of the utmost importance that such supply should consist of both flesh-formers and heat-givers, and in the proportion of two parts of the former to six of the latter. Milk is a model food, as it furnishes all the nourishment required, and in due proportion. Oatmeal may also be called a model food, as it contains one part of flesh-formers and 5½ parts of heat-givers. In fine wheaten flour the proportion is as one to eight, a part of the flesh-forming body having been removed in its preparation. The adulteration of any article of food reduces one or both of its essential constituents, hence such practices should be strongly condemned, and the adulterator severely punished.

2. *Zool.*: The food of animals is not directly derived from inorganic nature, but mediately through the agency of plants.

3. *Bot.*: Plants can feed upon and assimilate inorganic matter, in this respect differing from animals. A few plants, however, such as fungi, the Sun-dew (*Drosera*), and Venus Fly-trap, require animal food. The ordinary food of plants consists of carbon, water, and nitrogen.

† Crabb thus discriminates between *food*, *diet*, and *regimen*: "All these terms refer to our living, or that by which we live: *food* is here the general term; the others are specific. *Food* specifies no circumstance; whatever is taken to maintain life is *food*; *diet* is properly prescribed or regular *food*. *Food* is a term applicable to all living creatures; *diet* is employed only with regard to human beings who make choice of their *food*. *Diet* and *regimen* are both particular modes of living; but the former respects the quality of *food*: the latter the quantity as well as quality; *diet* is confined to modes of taking nourishment; *regimen* often respects the abstinence from *food*, bodily exercise, and whatever may conduce to health." (*Crabb: Eng. Synon.*)

There is not so much design, but there is more violence and impetuosity in rashness than in foolhardiness: the former is the consequence of an ardent temper which will admit of correction by the influence of the judgment; but the latter comprehends the perversion of both the will and the judgment." foot-bàll, s. [Eng. foot, and ball.]

I. Literally:

1. A ball, consisting of an inflated bladder, or globe of india-rubber incased in leather, and used in the game of football.

2. A game played with a football by two parties, generally consisting of fifteen players on each side. At each end of the ground is a goal formed by two upright posts or bars, six to eight yards apart with a bar extended between them at a height of eight or ten feet. The object of each side is to drive or force the ball through their adversaries' goal. There are two sets of rules at present in force for the regulation of the game, viz., the Football Association and the Rugby. By the former, in which the number of contestants is sometimes reduced to eleven, the ball must not be touched by the hands, but must be kicked. In the latter, while under the latter the player is allowed to take the ball in his hands and run with it. In the former also the ball must pass between the upright posts, and below the bar to become a goal; in the latter it must pass over the bar.

The sport since 1874 has been quite popular in America. At that period the first match game of Rugby football was played at Cambridge, Mass., between teams from Harvard and McGill. So rapidly did the game rise in favor that an intercollegiate association was formed, and teams were organized in all of the principal colleges and universities of the country. The contests between the teams gradually became more and more obstinate, until a positive danger attended the game, and this brought the sport into reprobation so severe that in 1894 the rules of the game were so altered and amended as to eliminate the greater portion of the brutal and dangerous practices which had disgraced the contests. The Rugby game is the game most affected in this country, the Association rules having, until a very recent date, but a very small following.

The footprints in the Silurian and other very antique rocks are mostly those produced by the claws of crustaceans. In the Triassic rocks of Connecticut, the footprints of thirty-two or more species of bipeds, and twelve of quadrupeds, have been found. In rocks of nearly the same age in Europe, footprints, so like those of the human hand that the animal making them was called at first *Chirotherium* (*q. v.*), was at last skillfully assigned by Prof. Owen to the genus of amphibians called by him, from its teeth, *Labyrinthodon*. It is in allusion to this phenomenon that Longfellow speaks of a hero leaving "footprints on the sands of time."

2. **Comp. Mythol.**: The first mention in history of gigantic footprints is by Herodotus (iv. 82), where he says he was shown a footprint of Hercules impressed on a rock, in the shape of a man's foot, but two cubits in length, and (ii. 91) he attributes sandals of the same size to Perseus. Traditions as to such footprints are found in all religions, the most common being that they were made when some god or hero ascended to heaven. Brahmans, Buddhists, Moslems, and Oriental Christians agree in reverencing the cavity in the rock, five feet long by two and a half feet wide, at the top of Adam's Peak, though their reasons for so doing are, of course, different. Like legends are also found in the islands of the Pacific, in this country, and in Mexico. The myth probably arose from rude peoples first investing chiefs or leaders of a bygone age with gigantic size; the next step was deification; then to imagine either fossil footmarks of some huge beast, or hollows naturally formed, or rudely sculptured rocks were the last impress of the foot of such hero as he ascended, was by no means difficult.

för-ä-mîn-if-ër-a, s. pl. [Lat. *foramen* (genit. *foraminis*) = a hole, an opening, an aperture, and *fero* = to bear. So named from their perforated shells. (See def.)]

1. *Zool.*: An order of animals belonging to the subkingdom *Protozoa*, and the class *Rhizopoda* (q. v.). The body is contained within a calcareous test or shell, which is polythalamous (many chambered). It may be cylindrical or spiral, or it may tend to the pyramidal form. The outer surface presents a punctate or dotted appearance, produced by the presence of very numerous foramina. (See def.)

The chambers in some are perfectly distinct from others, though so aggregated as to form a compound shell; in others they are connected with a funnel-like tube. The inside of the shell has an extensible and contractile sarcodermis of a reddish or yellow color, a thin film of which also invests its outside. Foraminifers are always of small size, and often indeed microscopic. With the exception of *Gromia*, which occurs both in fresh and salt water, they are exclusively marine. Sometimes their shells constitute sea-sand. In the Atlantic, at a depth of 3,000 fathoms, there is an ooze composed almost entirely of *Globigerina*, which belong to this order; the stratum thus formed is a direct continuation of the white chalk deposit, having gone on apparently through the whole Tertiary period. Drs. Carpenter and Parker, and Prof. T. Rupert Jones have divided the *Foraminifera* thus:

Sub-order I.—*Imperforata*. Families: (1) *Gromida*, (2) *Miliolida*, (3) *Litcolida*.

Sub-order II.—*Perforata*. Families: (1) *Lagenida*, (2) *Globigerinida*, and (3) *Nummulinida*.

2. *Palæont.*: The exceedingly antique *Eozoon* of the Laurentian rocks, if organic, as it is generally believed to be, was apparently a *Foraminifer*. Forms more unequivocal, some of them very like recent species, occur in the Silurian, the Carboniferous, and other strata. They are found through all the Secondary period, chalk being almost entirely composed of their cases. [1.] They increase in number and importance in the Tertiary. The *Nummulites* of the Middle Eocene are *foraminiferous* animals. The type of the order has remained wonderfully constant from the earliest times till now.

† Crabb thus discriminates between *to forbid*, *to prohibit*, and *to interdict*: "*Forbid* is the ordinary term; *prohibit* is the judicial term; *interdict* the moral term. *To forbid* is a direct and personal act; *to prohibit* is an indirect action that operates by means of extended influence: both imply the exercise of power or authority of an individual; but the former is more applicable to the power of an individual, and the latter to the authority of government. *Interdict* is a species of *forbidding* applied to more serious concerns. A thing is *forbidden* by a word; it is *prohibited* by a law: hence that which is immoral is *forbidden* by the express word of God; that which is illegal is *prohibited* by the laws of man. . . . *To forbid* or *interdict* are opposed to command; *to prohibit*, to allow. *Forbid* and *interdict*, as personal acts, are properly applicable to persons only, but by an improper application are extended to things; *prohibit*, however, in the general sense of restraining, is applied with equal propriety to things as to persons; shame *forbids* us doing a thing; law, authority, and the like, *prohibit*." (3) *Animal force*:
Physics: The muscular strength of man, horses, asses, cattle, or other animals viewed as a moving power.

(4) *Centrifugal force*: [CENTRIFUGAL.]

(5) *Centripetal force*: [CENTRIPETAL.]

(6) *Composition of forces*:
Physics: A force produced by two other forces acting on a body. If they operate in the same direction the resultant or the resulting force will be the sum of both. If the two forces act in opposite directions and are equal, they will make the body remain at rest; if they be unequal, they will move in the direction of the greater one, and with a force equivalent to their difference. If the lines of direction make an angle with each other the resultant will be a mean force in an intermediate direction. If many forces act, the resultant is the line of motion or state of rest produced by their conjoint action. [Resolution of Forces; PARALLELOGRAM.]

(7) *Conservation of force, or of energy, or of vis viva*:
Physics: The doctrine or principle that in all cases force is conserved—i. e., kept in existence even when it appears to perish. Just as a certain definite amount of matter exists in the universe, to which man cannot add, and from which he cannot subtract an atom, so a definite amount of force, incapable of being increased or diminished, exists like the former, in the universe. It can, however, be transformed so as to look quite unlike its former self; but in every case the force or energy communicated to a body or system of bodies is withdrawn from some fund or energy previously existing. [Correlation of force.]

(8) *Correlation of force, energy, or vis viva*:
Physics: The doctrine or principle that the different kinds of force in the universe are so correlated together that any one can be transformed into an exactly equivalent amount of another. There is equality when one can do precisely the same amount of work as any other. It has long

been known that in a machine, the screw for example, what is gained in power is lost in velocity, and vice versa. At first sight motion and heat seem to have no relation to each other; but if a moving body be suddenly arrested in its career, as, for instance, a bullet by a target, heat will be generated, and the same number of units of the work which the motion was capable of effecting can be achieved also by the heat. Conversely, a certain amount of heat can produce an equivalent one of motion; thus the working energy communicated to the piston of a steam-engine is withdrawn from the heat of the steam, and exactly balances the latter. Similarly, when the form of a body is changed by the action of forces, in the way that a spring may be coiled up, the exact amount of force requisite to roll it into form will exist as potential energy in the spring.

(9) *Effective force*: [VERTICAL.]

(10) *Equilibrium of forces*:

Physics: The action of forces which, balancing each other, produce an equilibrium or state of balance, or rest in the body or bodies on which they operate.

(11) *Impressed force*: [VERTICAL.]

(12) *Impulsive force*:

Nat. Phil.: A force which acts on a body for an unappreciably short time, as when one body strikes another. It is called also an instantaneous force (q. v.).

(13) *Instantaneous force*: [Impulsive force.]

(14) *Kinetic force*:

Physics: The actual force excited by a moving body as distinguished from the potential force which it is capable of creating.

(15) *Measure of force*:

Physics: The measurement of the magnitude of a force, which is done by noting the momentum which it communicates to a body in a unit of time. [Unit of force.]

(16) *Mechanical force*:

Physics: Force of a mechanical nature acting on material bodies. It may be either that of the active force of a body in motion, or the tension or resistance opposed by a body at rest.

(17) *Molecular forces*:

Nat. Phil.: Forces which by means of certain attractions and repulsions, retain the atoms of matter side by side without their touching each other. [ATOM; MOLECULES.]

(18) *Moments of force*: [MOMENT.]

(19) *Moral force*:

Mental Phil.: Force operating on the human mind as distinguished from Physical force (q. v.). A threat is the exertion of moral force, a blow is the application of physical force.

(20) *Natural forces*:

Nat. Phil.: The physical agents which act upon matter. Specif. gravitation, heat, light, magnetism, and electricity.

(21) *Parallelogram of forces*: [PARALLELOGRAM.]

(22) *Physical force*:

Ord. Lang. & Physics: The operation of any thing physical or mechanical on a material body. It is opposed to Moral force (q. v.).

(23) *Polar forces*:

Magnetism, Elect., &c.: Forces acting at the two opposite poles of a body.

(24) *Polygon of forces*: [POLYGON.]

(25) *Potential force*:

Physics: The whole force which a body in motion can exert, as distinguished from the kinetic force which it is exerting at the specific moment of time.

(26) *Resisting and retarding forces*:

Physics: Forces which tend to resist or retard the progress of a moving body.

(27) *Resolution of forces*:

Physics: The resolution or decomposition of a force into the forces which by their conjoint action produced it.

(28) *Retarding forces*: [Resisting forces.]

(29) *Triangle of forces*: [TRIANGLE.]

(30) *Unit of force*:

Physics: The force which, acting on a pound of matter, would in one second produce a velocity of a foot per second.

¶ (1) *Of force*: Of necessity; necessarily.

She must lie here of mere necessity."

Shakespeare: *Love's Labor's Lost*, i. 1.

* (2) *No force*: No matter.

Touceley *Mysteries*, p. 16.

* (3) *To make force*, **To give force*: To care, to be concerned.

"Thereof mad thai no force."

Robert de Brunne, p. 204.

(4) *To come into force*: To be enforced; to be carried out.

¶ (1) Crabb thus discriminates between *force* and *violence*: "Both these terms imply an exertion of strength; but the former in a much less degree than the latter. *Force* is ordinarily employed to supply the want of a proper will, *violence* is used to counteract an opposing will. *Force* is mostly conformable

to reason and equity; *violence* is always resorted to for the attainment of that which is unattainable by law. In an extended and figurative application to things, these terms convey the same general idea of exerting strength." (Crabb: *Eng. Synon.*)

(2) For the difference between *force* and *energy*, see ENERGY.

Min.: A piece of timber placed in a level shaft to keep the ground open.

1. *Mech.*: A pump which delivers the water under pressure, so as to eject it forcibly or deliver it at an elevation. The term is used in contradistinction to a lift-pump, in which the water is lifted, and simply runs out of the spout. The single-acting force-pump is that in which the lift and delivery are alternate. The double-acting is that in which the passages are duplicated, so that a lift and delivery are obtained by each motion of the plunger; the pump has a distinct water-way both above and below the piston, so as both to draw and force water at each stroke, and thus cause a continuous stream, which is rendered more uniform by an air-chamber.

2. Foreign enlistment:

Law & Hist.: The act of enlisting in the naval or military service of a foreign power. The policy of the United States has always been to discourage the enlistment of its citizens in the service of another country, particularly in time of war, while it absolutely prohibits the enlistment of its citizens or the giving aid in any way to either party in case of civil war in a foreign country. A notable instance of this occurred in recent years during the Cuban rebellion, when a number of recruits were confined on Governor's Island, New York, and prevented joining the ranks of the insurgents. On the other hand, the long litigation between England and this country over the "Alabama claims" arose from the fact that England had allowed the building, equipment, and escape from her ports of a vessel designed to aid the states then in rebellion against this government. This policy of non-interference is general among civilized nations, and an individual enlisting in foreign service forfeits his rights of citizenship and protection under his natal government.

Crabb thus discriminates between *foresight*, *forecast*, and *premeditation*: "*Foresight*, from seeing before, denotes the simple act of the mind in seeing a thing before it happens; *forecast*, from casting the thoughts onward, signifies coming at the knowledge of a thing beforehand by means of calculation; *premeditation*, from *meditate*, signifies obtaining the same knowledge by force of meditating or reflecting deeply. *Foresight* is the general and indefinite term; we employ it either on ordinary or extraordinary occasions; *forecast* and *premeditation* mostly in the latter case: all business requires *foresight*; state concerns require *forecast*; *foresight* and *forecast* respect what is to happen; they are the operations of the mind in calculating futurity; *premeditation* respects what is to be said or done; it is a preparation of the thoughts and designs for action; by *foresight* and *forecast* we guard against evils and provide for contingencies; by *premeditation* we guard against errors of conduct." för-ést, *s. & a.* [O. Fr., from Low Lat. *forest*=a forest; *forestis*=an open space of ground over which the rights of chase were reserved, from Lat. *foris*=out of doors; Fr. *forêt*; Ital. *foresta*; O. H. Ger. *forst*.]

A. As substantive:

1. *Ord. Lang.:* An extensive wood, or tract of wooded country; a wild, uncultivated tract of ground interspersed with wood.

"Hys forest and hys wodes, and mest the nywe forest,
That ys in Southhamtesseyre."
Robert of Gloucester, p. 375.

II. Technically:

1. *Botanical Geog.:* Of the acreage of Great Britain about 4 per cent. are in woods; of Ireland, 1½ per cent.; of France, 16 per cent.; of Prussia, 23 per cent.; of Austria, 31 per cent.; and of Russia,

42½ per cent. Of the United States, once almost a continuous wilderness of trees, only 25 per cent. of the surface is now covered with wood. The British Empire has of forest, or of woods, 340,000,000 acres, which is more than is possessed by any other country in the world.

2. *Meteor.:* The clearing of forests in this country, France, &c., has made the climate less extreme than formerly—that is, the winters have been less cold and the summers less hot. Forests do not increase the rainfall, but they prevent it from easily running to waste. The destruction of the forests in the once fertile Palestine, Syria, and Cyprus has made those countries comparatively barren.

3. *Geol.:* The influence of forests in the economy of nature is conservative. A covering of herbage and shrubs tends to protect a loose soil from being carried away by rain or even by the ordinary action of a river, and to prevent hills of looses and from being blown away by the wind. When trees, in a cold climate, on their fall obstruct the drainage of a forest, peat is in many cases generated, and peat-bogs now mark the site of some old forests. Sometimes a depression of the land, a landslip, or some other cause, places a forest under the water. It is then said to be submerged (q. v.). If the waters are those of the ocean, it is said to be submarine (q. v.). In certain cases insects can destroy a forest by killing the trees of which it is composed. At certain spots a fossil or buried forest exists. Fossil forests are occasionally found in the coal measures.

B. As adj.: Of or pertaining to a forest; as, *forest trees*; *silvan*, *rustic*.

"Like crowded forest trees we stand,
And some are marked to fall."
Copper: Bill of Mortality, (1781.)

Crabb thus discriminates between *forest*, *chase*, and *park*: "*Forest*, *chase*, and *park* are all habitations for animals of venery; but the *forest* is of the first magnitude and importance, it being a franchise and the property of the king; the *chase* and *park* may be either public or private property. The *forest* is so formed of wood, and covers such an extent of ground, that it may be the haunt of wild beasts; of this description are the *forests* in Germany; the *chase* is an indefinite and open space that is allotted expressly for the chase of particular animals, such as deer; the *park* is an inclosed space that serves for the preservation of domestic animals." (*Crabb: Eng. Synon.*)

forest-glade, *s.* An open, grassy plot in a forest.

forest-laws, *s. pl.*

English Law: Laws for the regulation of the forest. These were instituted under the Conqueror, and were so severe that the *Saxon Chronicle* said he loved a deer as if he were its father. A man killing one might be mutilated and put to death. This was abolished by the Carta de Foresta (Forest Charter), granted by Henry III. in A. D. 1224. Gradually the forest-laws fell nearly into desuetude. Charles I. attempted to revive them, and the Forest Court of Justice Seat fined certain persons heavily for encroachments on the forests committed three or four centuries previously. The Long Parliament put an end to these extortions. [FOREST-COURT.]

forest-sheriff, s. The guardian or keeper of a forest; a verderer. (*Eng.*)

forest-spirits, s. pl.

Comp. Mythology: Certain spirits said to haunt forests. In the Australian bush, according to the belief of the natives, demons whistle in the branches, and sneak among the trunks to seize the wayfarer; the same belief is found in Brazil, among the Karens, the negroes of Senegambia, and the Indians of North and South America; and the baleful shapes of terror that glide through our own woodlands are familiar still to peasant and poet. All these imaginary beings have been devised to account for the mysterious influences that beset the wanderer in the forest. In some cases the belief is that spirits do not roam through the forest at large, but inhabit particular trees, growing with their growth and losing power with their decay. A similar conception belonged to the mythology of Greece and Rome, and in all cases the spirit inhabitant was supposed to have supernatural power, and sometimes to utter oracles. (*Tylor.*) [SERPENT-WORSHIP, TREE-WORSHIP.]

The first and shortest of these vanes is called the ten-cross, and belongs to that side of the instrument whereon the divisions begin at 3° and end at 10°. The next longer vane, called the thirty-cross, belongs to the side of the staff graduated from 10° to 30°. The sixty-cross belongs to the side graduated from 20° to 60°. ¶ Crabb thus discriminates between *foretell*, *to predict*, *to prophesy*, and *to prognosticate*: "*Foretell* is the most general in its sense, and familiar in its application: we may *foretell* common events, although we cannot *predict* or *prophesy* anything important: *to foretell* is an ordinary gift; one *foretells* by a simple calculation or guess: to *predict* and to *prophesy* are extraordinary gifts: one *predicts* by a supernatural power real or supposed; one *prophesies* by means of inspiration. *Prediction* as a noun is employed for both the verbs *foretell* and *predict*; it is therefore a term of less value than *prophesy*. We speak of a *prediction* being verified, and a *prophecy* fulfilled. *To prognosticate* is an act of the understanding; it is guided by outward symptoms as a rule; it is only stimulated and not guided by outward objects: a physician *prognosticates* the crisis of a disorder by the symptoms discoverable in the patient." (*Crabb: Eng. Synon.*)

fö-re-täll-är, s. [**Eng. foretell**; -er.] One who or that which foretells; a predictor; a prognosticator.

¶ Crabb thus discriminates between *to forgive*, *to pardon*, *to remit*, and *to absolve*: "*Forgive* and *pardon* both signify not to give the punishment that is due: to relax from the rigor of justice in demanding retribution. *Forgive* is the familiar term; *pardon* is adapted to the serious style. Individuals *forgive* each other personal offenses; they *pardon* offenses against law and morals: the former is an act of Christian charity, the latter an act of clemency. . . . *Pardon*, when compared with *remission*, is the consequence of offense; it respects principally the person offending; it depends upon him who is offended; it produces reconciliation when it is sincerely granted

and sincerely demanded. *Remission* is the consequence of the crime; it has more particular regard to the punishment; it is granted either by the prince or magistrates; it arrests the execution of justice. *Absolution* is taken in no other sense; it is the consequence of the fault or the sin, and properly concerns the state of the culprit." (a) The assemblage of qualities which make a body, a substance, or anything be what it is. Whatever is accidental or adventitious in the individual examined or specimen of the substance examined is excluded from examination, and only what is essential taken into account; hence in place of the simple word *form*, the compound one *essential-form* or *substantial-form* is generally employed.

(b) The mode in which any object is manifested to the senses, or the intellect. Thus the clouds manifest themselves to the perceptive powers as occupying a certain position, as having a certain shape, and as colored with certain hues. The forms of immaterial things are called categories.

(2) *Subjectively*: The idea or concept which the mind forms of an object as distinguished from the object itself. According to the philosophy of Kant, it was the province of the sensitive faculty to communicate to the mind the matter of a notion, and that of the understanding to give it form.

7. *Zool.*: A distinction sometimes used for those minute variations which are not constant enough to be called varieties.

* (1) Crabb thus discriminates between *form*, *figure*, and *conformation*: "*Form* is the generic term; *figure* and *conformation* are special terms. The *form* is the work either of nature or art; it results from the arrangement of the parts; the *figure* is the work of design; it includes the general contour or outline; the *conformation* includes such a disposition of the parts of a body as is adapted for performing certain functions. *Form* is the property of every substance; and the artificial *form* approaches nearest to perfection, as it is most natural; the *figure* is the fruit of the imagination; it

is the representation of the actual *form* that belongs to things; it is more or less just as it approaches to the *form* of the thing itself; the *conformation* is said only with regard to animal bodies. *Form* and *figure* are used in a moral application, although *conformation* is not."

(2) He thus discriminates between *form*, *ceremony*, *rite* and *observance*: "*Form* is the most general in its sense and application; *ceremony*, *rite*, and *observance* are particular kinds of *form*, suited to particular occasions. *Form*, in its distinct application, respects all modes of acting and speaking, that is adopted by society at large, in every transaction of life; *ceremony* respects those forms of outward behavior which are made the expressions of respect and deference; *rite* and *observance* are applied to national ceremonies in matters of religion." (Crabb: *Eng. Synon.*)

* (1) Crabb thus discriminates between *to form*, *to fashion*, *to mold*, and *to shape*: "*To form* is to put into a form, which is the generic term; *to fashion* is to put into a particular or distinct form; *to mold* is to put into a set form; *to shape* is to form simply as it respects the exterior. As everything receives a form when it receives existence, *to form* conveys the idea of producing. When we wish to represent a thing as formed in any distinct or remarkable way, we may speak of it as *fashioned*."

(2) He thus discriminates between *to form*, *to compose*, and *to constitute*: "*Form* is a generic and indefinite term. *To compose* and *constitute* are modes of forming. These words may be employed either to designate modes of action or to characterize things. Things may be *formed* either by persons or things; they are *composed* and *constituted* only by conscious agents." (Crabb: *Eng. Synon.*)

A person expects to have a *formal* dismissal before he considers himself as dismissed; people of fashion pay each other *ceremonious* visits, by way of keeping up a distant intercourse. *Formal*, in the bad sense, is opposed to easy; *ceremonious* to the cordial. formative-arts, s. pl.

Art: Those arts which, independently of external wants and aims, yet, on the other hand, bound to the imitation of nature, represent life by means of the forms naturally connected. The general style of the formative arts is the result of a principle of selection which necessarily limits imitation. Such general style consists, therefore, in qualities which distinguish these arts from nature. The specific style of any one of the arts consists in the effective use of those particular means of imitation which distinguish it from the other arts. Style is complete when the spectator is not reminded of any want which another art or which nature could supply. (*Fairholt*.)

The two first may be said of what happens within the age of man; the last two are extended to many generations and ages. Any individual may use the word *formerly* with regard to himself: thus, we enjoyed our health better *formerly* than now. An old man may speak of *times past*, as when he says he does not enjoy himself as he did in *times past*. *Old times*, *days of yore*, and *anciently*, are more applicable to nations than to individuals; and all these express different degrees of remoteness." formic acid, s.

Chem.: HCHO or $\text{H}\cdot\text{CO}\cdot\text{OH}$. A monobasic fatty acid, which derives its name from the circumstance that it was first obtained by distilling ants. It occurs in the animal and vegetable kingdoms, especially in the red ant, *Formica rufa*. When an ant walks over moistened blue litmus it turns it red. It exists also in certain caterpillars, in several secretions of the human body, as in blood, in urine, in the flesh-juice and in perspiration. It is also found in the juice of the stinging-nettle, and in commercial oil of turpentine that has been exposed to the air, and in certain mineral springs. Formic acid can be obtained by the oxidation of methyl alcohol $\text{CH}_3\cdot\text{OH}$, and by boiling hydrocyanic acid HCN with hydrochloric acid. Formic acid is obtained by distilling sugar, gum, and starch with strong sulphuric acid, but it is best prepared by heating oxalic acid, $\text{H}_2\text{C}_2\text{O}_4$, with an equal quantity of glycerine, $\text{C}_3\text{H}_5(\text{OH})_3$, in a retort on a water-bath; it gives off CO_2 and dilute formic acid distills over. When no more gas is given off, more oxalic acid is added; it is again heated, and a more concentrated formic acid comes over. In this reaction an ether of glycerine with one formic radical is first formed. Thus,

hydroous acid is obtained by heating to 100°C . lead formate $(\text{H}\cdot\text{CO}\cdot\text{O})_2\text{Pb}$ in a stream of sulphuretted hydrogen gas. Pure formic acid is a colorless, transparent liquid, which slightly fumes in the air. It has a pungent, sour taste, and corrodes the skin, forming painful ulcers. Formic acid solidifies at -1° and boils at 99° . It mixes with water and with alcohol in all proportions; its vapor is inflammable, and burns with a blue flame. Formic acid, heated with concentrated sulphuric acid, is decomposed into carbon monoxide, CO, and water. Formic acid reduces salts of gold, silver, and mercury, being converted into carbon dioxide and water. By the

boil, boy; pout, jowl; cat, cell, chorus, chin, bench; go, gem; thin, this; -cian, -tian = shán. -tion, -sion = shün; -tion, -sion = shün. -tious, -cious, -sious = shüs. -ble, -dle, &c. = bel, del.

action of chlorine, formic acid is converted into hydrochloric acid and CO_2 . All salts of formic acid are soluble in water; their aqueous solutions are turned red by the addition of ferric chloride.

formic-ethers, s. pl.

Chem.: Chemical substances in which the basic hydrogen of formic acid has been replaced by an alcohol radical.

His chief assistants were first and last Martin Chemnitz, Nicholas Schnecker, Andrew Musculus, Christopher Ōrner, and David Chytaus. The formula was published in 1580, all clergymen and schoolmasters being required by the Elector to subscribe to it. It was abolished in the canton of Berne and the republic of Geneva in 1686, and ultimately became incapable of enforcement anywhere. (Mosheim.)

¶ The development of modern ordnance has rendered fortification as exhibited in the construction of the fortresses of the past practically obsolete and useless. It is probable that no fortress in the world (with the exception, perhaps, of Gibraltar, the natural situation of which renders it inexpugnable) would form a serious obstacle to a modern naval or land attack, if the assailants were provided with the most approved modern heavy guns. In view of this fact the construction of fortresses has been directed almost entirely to enabling them to cause a ricochet of shots directed against them rather than to oppose the direct impact. Hence modern fortresses are usually small, and present nowhere a direct angle to the line of fire, being generally constructed on the turtle-back or spherical plan. They usually contain but few guns, and those of the heavier calibers, rendering them offensive, rather than great strongholds of defense, as formerly. Of this latter class the strongest fortress surviving in the United States is Fortress Monroe, on

Hampton roadstead in Virginia, erected for the defense of Norfolk navy-yard and the Virginian coast at that point. It was planned and built by a French engineer, and was an important Federal stronghold during the civil war. Other important historical fortresses are McHenry, Moultrie, Pickens, Webster, St. Augustine and Sumter.

The greatest fortress in the world, from a strategic point of view, is the famous stronghold of Gibraltar, on the coast of Spain. It occupies a rocky peninsula jutting out into the sea, about three miles long and three-quarters of a mile wide. One central rock rises to a height of 1,435 feet above the sea-level. Its northern face is almost perpendicular, while its east side is full of tremendous precipices. On the south it terminates in what is called Europa Point. The west side is less steep than the east, and between its base and the sea is the narrow, almost level span on which the town of Gibraltar is built. The fortress is considered impregnable to military assault. The regular garrison in time of peace numbers about 7,000. It belongs to England.

"I am most fortunate thus accidentally to encounter you."—*Shaksp.: Coriolanus*, iv. 3.

¶ (1) Crabb thus discriminates between *fortunate*, *lucky*, *prosperous*, and *successful*: "The *fortunate* and *lucky* are both applied to that which happens without the control of man; but the latter, which is a collateral term, describes the capricious goddess Fortune in her most freakish humors, and *fortunate* represents her in her most sober mood; in other words, the *fortunate* is more according to the ordinary course of things; the *lucky* is something sudden, unaccountable, and singular. *Prosperous* and *successful* seem to exclude the idea of what is *fortuitous*, although *prosperity* and *success* are both greatly aided by good *fortune*. *Fortunate* and *lucky* are applied as much to the removal of evil as to the attainment of good; *prosperous* and *successful* are concerned only in what is good, or esteemed as such: we may be *fortunate* in making our escape; we are *prosperous* in the acquirement of wealth. *Fortunate* is employed for single circumstances, *prosperous* only for a train of circumstances. The *fortunate* and *lucky* man can lay no claim to merit, because they preclude the idea of exertion; *prosperous* and *successful* may claim a share of merit proportional to the exertion." (*Crabb: Eng. Synon.*)

"Language is fossil poetry."—Emerson: *Essays*; *The Poet*.

B. As substantive:

1. Literally:

1. Originally: Anything dug up.

"Fossils, all bodies whatever that are dug out of the earth are by naturalists commonly called by the general name of fossils."—Glossog. Nov. (1719.)

¶ Johnson (1776) gives no other meaning to the word *fossil* than "that which is dug out of the earth." Prof. Robt. Jamieson, in his mineralogical and geological works, published early in this century, used the word *fossil* in this obsolete sense, often calling minerals fossils.

2. Now: Any body, or the traces of the existence of any body, whether animal or vegetable, which has been buried in the earth by natural causes; one of the bodies called organic remains. Even the cast of a fossil shell, that is the impression which it has left on the rock, is deemed a fossil. (Used often in the plural.)

¶ In the early part of the sixteenth century fossils were supposed by some Italians to have been formed in the hills by the action of the stars, a view which, prior to 1579, Leonardo da Vinci combated. Then the hypothesis arose of a plastic force, or, according to Andrea Mattioli, a fatty matter capable of fashioning stones into organic forms. But the hypothesis which held its place longer than any other, and is not yet extinct among the unscientific, is that they were relics of the Mosaic deluge. It is now thoroughly proved that the relics are really those of plants and animals, that they were nearly all of them in existence ages before the Mosaic deluge, that they are not nearly contemporaneous with each other, but differ in age by untold millions of years, that there is at least a progression among them, if not even the evolution of the last from the more antique. There are breaks or gaps in the series of fossiliferous strata, especially one between the paleozoic and the secondary strata, and another between the secondary and the tertiary. Once it was supposed that there had been in the earth's geological history alternate periods of repose and convulsion; now it is believed that there would be no breaks if all lands were geologically explored, if all strata now submerged were accessible for investigation, and if local causes acting during bygone ages had been less effective in destroying portions of the record. Mr. Darwin shows that it is almost exclusively strata deposited in seas or lakes which at the time were slowly sinking that have been preserved; those formed when land was rising have, as a rule, been washed away. In the older strata, and sometimes in those not so ancient, fossils have been destroyed by metamorphic action, and when any rock is called non-fossiliferous or azoic, the cautious geologist means by the term only that fossils have not been found in it up to the present time. What coins are to the numismatologist and the historian, that fossils are to the paleontologist and the geologist; they enable him to recover forgotten chapters of history. Fossils are, however, more valuable than coins, they cannot any of them be so easily forged, and few of them can be forged at all.

foundation-sacrifice, *s.*

Comp. Mythol.: A sacrifice common to races of low culture, who sought to render buildings firm and stable by drenching the foundation-stones with blood, by burying a human victim beneath them, or by immuring some unfortunate wretch in the structure itself. Tradition asserts that such sacrifices were practiced in the Middle Ages in some form or other, at the castle of Liebenstein in Thuringia, at the walls of Copenhagen, and at Scutari, and Tylor states that so late as 1843, when a new bridge was built at Halle, a notion was abroad among people that a child was wanted to be built into the foundations. The idea underlying these sacrifices was the propitiation of evil spirits, or an endeavor to render them, in some sort, guardians of the structure. Hugh Miller (in his *My Schools and Schoolmasters*, ch. xi.), relates a conversation he had with a herd-boy on the subject of ghosts. The boy said: "It's the spirit of the man who was killed on the foundation-stone, just after it was laid, and then built into the wa' by the masons, that he might keep the castle by coming back again; and they're saying that a' the vera old houses in the kintra had murdered men builded intil them in that way, and that they have a' o' them their bogle." The buccanniers of the Spanish Main are said to have killed and buried a negro or a Spaniard with their treasures, that his spirit might haunt the spot and drive away intruders. In this case, of course, the dominant idea was that of guardianship. There seems to be an allusion to some such rite in the

book of Joshua: "He shall lay the foundation thereof in his firstborn, and in his youngest son shall he set up the gates of it" (vi. 26). The custom still lingers in some parts of Asia and Africa, and in Polynesia and Borneo.

Polit. Econ. & Hist.: A system partly of coöperation, partly of socialism, advocated, and to a certain extent carried out, by Charles Fourier, a Frenchman, born at Besançon, April 7, 1772. He was for some considerable time in a merchant's office, and was at a susceptible age when the ferment produced by the first French Revolution was continually bringing new views as to the reorganization of society before men's minds. A benevolent man, he for years attempted to devise a scheme for the benefit of society, and in a series of publications, which both thereviewers and the public, as a rule, ignored, made known the opinions since called by his name. He was a devout but liberal Roman Catholic, and a student of prophecy, and believed that he was acting in conformity with Scripture principles in proposing his scheme. He died in Paris on Oct. 10, 1847, in his 66th year, too early to foresee the extent to which his views on the relations of capital and labor were destined ultimately to spread.

Fourier's scheme was that what he called 'from the word phalanx, a phalanstery, consisting of about 400 families, or 1,800 persons, should live together, combining their labor, upon a district about a square league in extent. The buying and selling transactions requisite for the support of the community, were to be managed by a single person, which would save a multitude of peddling operations. If any brought capital into the concern, it was not confiscated, but he was allowed interest upon it. The labor being carried on in common, the

profits were apportioned on the following system: First a minimum of mere subsistence money was assigned to every member of the society, including those incapable of labor. The remainder of the profits were then divided in proportions agreed on beforehand, to remunerate labor and talent, and pay interest on the capital received. The profits divided thus were then expended by the individual recipients as they pleased. An effort was made about 1852 to form an industrial colony on Fourier's plan, but the attempt was unsuccessful.

2. A privilege; a right granted by the head of government to an individual or to a body; an immunity or exemption from ordinary jurisdiction.

"*Franchise* and *liberty* are used as synonymous terms; and their definition is—royal privilege or branch of the sovereign's prerogative, subsisting in the hands of a subject; the kinds of them are various, and almost infinite. To be a county palatine is a *franchise*, vested in a number of persons. It is likewise a *franchise* for a number of persons to be incorporated and subsist as a body politic. Other *franchises* are to have a manor or lordship; to have waifs, estrays, royal fish; to have a fair or market; or to have a forest, warren, or fishery, endowed with privileges of royalty."—Blackstone: *Comment.*, bk. ii., ch. 2.

¶ The franchise granting the right of suffrage is in this country almost entirely a matter subject to state legislation, although the rights and privileges and the restrictions, likewise, attendant on the franchise must in no wise conflict with the constitution and laws of the United States. Thus, as an example, in some of the states any participation in a duel will disfranchise a man, and render him ineligible for any office within the gift of the state, but it will not affect his eligibility for the office of president of the United States.

3. The district or extent of jurisdiction to which a certain privilege or right extends; the limit of a privilege or immunity.

"In the great franchises of the latter . . . the king's writ had no course."—Hallam.

4. A sanctuary or asylum for persons liable to be arrested.

"The king's sheriffs are empowered to enter all franchises for the apprehension of felons or traitors."—Hallam.

5. Frankness; generosity; nobility.

"Here may ye seen, how excellent *franchise*

In woman is when they hem narwe advise." Chaucer: *C. T.*, 9,861.

***B. As adj.**: Enjoying a franchise or privilege; privileged.

"Yet he was fayne to departe and to go to Trete, a franchises towne for all maner of people, payng for that they take."—Berners: *Froissart; Chronicle*, vol. ii., ch. cli.

A. As adj.: Pertaining or relating to St. Francis. [B.]

B. *As substantive*:

1. *Sing.*: A member of the order described under 2.

2. *Pl.*: The followers of St. Francis, who was born in 1182, at Assisi, in Umbria, and spent his youth in dissoluteness; but being affected with serious sickness in his twenty-fourth year, and repenting of his sins, devoted himself to a religious and ascetic life. Hearing accidentally in 1208, in a church the words of the Savior (Matt. x. 9, 10), he considered that the essence of the Gospel was absolute poverty, and founded an order on this basis, which ultimately became one of the four, nay, even one of the two,

great fraternities of mendicant friars. To manifest his humility he would not allow his followers to be called brethren (in Lat. *fratres*), but only little brothers (Ital. *fratricelli*; in Lat. *fratresculi* or *fratres minores*), a designation which they still retain. Pope Innocent III., in 1210, and a council of Lateran, in 1215, approved of his rules for the government of his order, which enjoined poverty, chastity, and obedience, and in 1223 Pope Honorius III. issued a bull in his favor. He died, at Assisi, in 1226, and in 1230 was canonized by Pope Gregory IX., the anniversary of his death, October 4, being fixed as his festival. Even while he lived his order had become very powerful, and spread over the whole Western Church. In 1219 it is stated that 5,000 friars were present at a chapter which he held. In that year, or more probably in 1224, Franciscans went over to England. From 1228 till 1259 they contended with the Dominicans about precedence. When in 1274 Gregory IX. reduced the mendicants to four orders the Franciscans were one of the four. At the suppression of the monasteries in England under Henry VIII., A. D. 1536 to 1538, the Franciscans had sixty-six abbeys or other religious houses. Their dress was a loose garment of a gray color, reaching to their ankles, and a gray cowl, covered when they went into the streets with a cloak. From the prevalence of gray in their dress they were called Grayfriars. The order, in the course of its history, split into various branches.

Fraunhofer's lines, *s. pl.*

Optics: Certain dark lines discovered by Wollaston, in 1802, in the solar spectrum, but first described in detail by Fraunhofer. If a pencil of solar rays be admitted through a narrow slit into a dark room, and then the slit be looked at through a prism of flint glass very free from flaws, the lines will be seen delicately traced in large numbers parallel to the edge of the prism, and at very unequal intervals. Fraunhofer names the most remarkable of them A, B, C, D, E, b, F, G, and H. A is at the beginning of the red ray, B in the middle, and C at the boundary between it and the orange, D in the orange, E in the green, F in the blue, G in the indigo, and H in the violet: A is in the red and B in the green. About 3,000 lines have since been discriminated; some are fixed in position, others are variable. The latter are sometimes called atmospheric or telluric lines, being considered by certain physicists to be due to the absorption of the air. The study of these lines has since led to the introduction of the method of analysis called spectral analysis. (Ganot.)

It at times aids churches with pecuniary grants, but only if they are "free."

(2) *Free Church of England*:

Ecclesiol. & Eng. Ch. Hist.: An evangelical Protestant denomination founded on the basis of recognizing only two orders—the first being presbyters, and the second deacons. "Nevertheless, the first order is divided into two distinct offices—viz., bishops and presbyters. This church maintains the ecclesiastical parity of presbyters, whether episcopally or otherwise ordained." (*Declaration by Convocation of F. C. of England*, 1846.) The governing body is the Convocation, consisting of all the clergy and laity in the several churches. The impulse which gave the church birth was communicated by the Tractarian movement of 1832, a reaction against which created a few "free churches" in the West of England; the Shore controversy (1843 to 1849) and the Gorham case (1849-50) promoted its development. Hist.*: The name assumed by the large number of ministers and their adherents who left the Scottish Establishment at the "Disruption" of May 18, 1843. [DISRUPTION.] They had seceded in vindication of what they called the "Headship of Christ," i. e., to gain liberty to obey what they deemed the will of their Divine Lord in all Church arrangements.

When the Disruption took place, the financial difficulties which the secessionists had to face were very formidable. Wherever the Free Church had adherents, which was in nearly every parish, fresh places of worship had to be built in lieu of those lost; at least small stipends to be provided for the ministers whose stipends (whether provided by the state or their parishioners) were gone. All the Scottish established missionaries to the Jews or the Gentiles, having joined the seceding party, had to be provided for. After a certain breathing-time, theological colleges had also to be built, day schools and manses (in English, parsonages) provided in connection with the several churches. All was at last successfully accomplished, and great advance made, both at home and abroad. One part of the financial arrangements which has attracted most notice, was the Sustentation Fund (q. v.).

Its import is a gift conferred, not on account of merit in the recipient, but simply of grace—i. e., of free favor, with unmerited kindness. A. As substantive:

I. Ordinary Language:

1. The power of directing our own actions without any restraining or constraining influence or power.

"We have a power to suspend the prosecution of this or that desire; this seems to me the source of all liberty; in this seems to consist that which is improperly called free-will."—Locke.

2. Voluntariness, spontaneity.

"I make a decree, that all they of the people of Israel in my realm, which are minded of their own free-will to go up to Jerusalem, go with thee."—Ezra vii. 13.

II. Technically:

1. *Metaph.*: The power which the will has, or is supposed to have, to adopt either of two courses open to it, just as it pleases. From the philosophical point of view, however, this does not make the will really free. If it be under the control of intellect so clear, and so much preponderating over passion, that of two courses open to it, it uniformly

chooses the more eligible, then it is compelled by its very constitution so to act, and can that which is compelled be called free? If differently constituted, with feeble intellect and dominant passion, it cannot resist a certain temptation in its path, and therefore is what is popularly called the "slave" of a certain vice, the question may be asked, "Is a slave free?" From the philosophic view, there is a scheme of causation as perfect in the moral as in the material world, the wills of an infinite number of individuals constituting links of the chain. To reconcile "liberty" with "necessity" has long been attempted, but with limited success, though both are true. A first step toward its settlement is taken when it is shown, as Hume clearly does in his *Essay on Liberty and Necessity*, that the dispute carried on for ages on these subjects is only one about words, for the advocate for liberty grants all that the necessitarian asks, and the necessitarian all that is claimed by the advocate for liberty. A standard work on the subject is Jonathan Edwards' *Inquiry into the Freedom of the Will* (1754).

2. *Theol.*: The same difficulty exists in reconciling the omnipotence of God and the freedom of man's will with its attendant responsibility (Rom. ix. 19, 20). Christians in general accept both doctrines, though two antagonistic views—the Calvinistic and the Arminian—are entertained on the subject. [ARMINIAN, CALVINISM, FIVE POINTS.]

"Others . . . reasoned high
Of providence, foreknowledge, will and fate;
Fix'd fate, free-will, fore-knowledge absolute,
And found no end."—Milton: P. L., bk. ii. 560.

Frees every lock and leads us to his person."
Dryden: *Don Sebastian*, iv. 1.

*Crabb thus discriminates between to free, to set free, to deliver, and to liberate: "To free is properly to make free, in distinction from set free; the first is employed in what concerns ourselves, and the second in that which concerns another. . . . We are delivered or liberated from that which others have imposed upon us; the former from evils in general, the latter from the evil of confinement."

When applied in a spiritual sense free is applied to sin; set free is employed for obligation and responsibility; deliver is employed for external circumstances." (Crabb: *Eng. Synon.*)

During feudal times the English freeholder had to render some small services of an honorable kind; now these are abolished. A freehold estate must possess immobility, in other words must consist either of land or of some interest arising out of land annexed to it. Secondly, it must be of indeterminate duration.

frēe-mā-sōn-rŷ, s. [Eng. *free*, and *masonry*.] An association of free and accepted masons, a secret society, the more extravagant friends of which claim for it an antiquity extending back to the building of Solomon's Temple, if not even to the time when the Tower of Babel was erected. It is said that it was introduced into England about A. D. 678, that the Grand Lodge at York was founded in 928, and freemasonry was introduced into Scotland in 1140. Some, regarding at least the earlier of these dates as imaginary, allege that it did not come into existence until about the time of the Crusades; and that when it arose, it was simply the masonic guild, or, as it would now be called, trades' union. As the masons moved from place to place seeking employment upon cathedrals, abbeys, or other ecclesiastical edifices then being erected, they had secret signs by which they recognized each other, and proved that they were real proficient in the art which they professed, and not mere pretenders.

At first the Church looked on the Society with favor, but ultimately became unfriendly. In 1424 it was prohibited by the Act 3 Henry VI., c. 1, which, however, was never enforced. It is said that freemasonry did not take root in France till the sixteenth century. It was transplanted to this country before the revolution, George Washington being master of Fredericksburg Lodge, No. 4. In 1738 the Pope published a bull of excommunication against freemasons, and freemasonry was included among the errors condemned by the Syllabus in 1864.

II. Art: A kind of painting performed on fresh plaster, or on a wall covered with mortar not quite dry, and with water-colors. The plaster is only to be laid on as the painting proceeds, no more being done at once than the painter can dispatch in a day. The colors, being prepared with water, and applied over plaster quite fresh, become incorporated with the plaster, and retain their beauty for a great length of time. The art, which is employed generally for large pictures on walls or ceilings, was understood by the ancients. The Romans cut out plaster paintings on brick walls at Sparta, packed them up in wooden cases, and transported them to Rome. Fresco painting was first made of real importance by the Italians, in the sixteenth century. It is a very common error in this country with antiquaries and writers in general to term the ancient paintings frequently found on church walls, &c., *frescoes*; but there is scarcely an instance of a genuine *fresco* among them. They are distemper paintings on plaster, and quite distinct in their style, durability, and mode of manipulation. (Weale, *Fairholt*, &c.)

Browne: *Vulgar Errors*, bk. vii., ch. xiii.

fret (5), *s.* [Etyml. doubtful; perhaps a particular use of O. Fr. *frete*=a ferrule.] [FRET, (3), *s.*]

Music: A small piece of wood or ivory placed upon the finger-board of certain stringed instruments, to regulate the pitch of the notes produced. By pressing the string down to the finger-board behind a fret, only so much of the string can beset in vibration as lies between the fret and the bridge. Frets are, therefore, nothing more or less than little bridges. The Egyptian lutes had frets made of camel-gut, tied or glued around the finger-board. All the viols contained in a chest had frets, and some of the early forms of the violin were even furnished with them. But not only do they prevent the rapid fingering of difficult passages, but they also entirely deprive the violin of one of its most charming qualities, that of slurring or *portamento*, an attempt to produce which will, on a fretted instrument, result in a well-defined chromatic scale. Another reason for the abandonment of fretted violins was that, in extreme keys, the intervals could not be tempered.

"I did but tell her she mistooke her frets.
Frets call you these? (quoth she) I'll fume with them:
And with that word she stroke me on the head."

"The causes of complaints which have been so frequent of late, and which indicate a very undesirable amount of friction between English captains and shipping agents and the local staff."—*London Daily Chronicle*.

II. Physics: The resistance which any body meets with in moving over another body. No body is quite smooth, all have elevations and depressions, and when one moves over another some of the projecting points of the one are sure to enter the cavities of the other, and render movement more difficult. Friction is greater when a body previously at rest first begins to move. A horse which finds a difficulty in getting a heavy cart well in motion, owing to inertia largely produced by friction, will draw it without symptoms of distress when it has been for some time started. The larger and heavier the body the greater the friction. Friction is a retarding force in nature. It gives stability to bodies which else would be easily moved. It generates heat, and is one of the chief means of developing electricity. [FRICTIONAL ELECTRICITY.]

† *Coefficient of friction for two surfaces:*

Physics: The rates or proportions between the force required to move one of these surfaces over the other, and the pressure between the two surfaces.

B. As adj.: Pertaining to or implying friction; frictional.

friction-clutch, *s.*

Mach.: A device for connecting two shafts by bringing a piece on one shaft into contact with a piece of another shaft, which revolves with such force that the former partakes of the motion of the latter. It consists of a shell or box fixed on the end

of a driving-shaft, fitted by a conical piece which slides on a feather or raised part of the end of another shaft, so that it can be engaged at pleasure by the cone being forced into the shell by a lever or screw. This apparatus is very useful for driving machines, the parts of which are subject to violent strains, as the pressure upon the clutch can be regulated so as to allow it to slip when the strain is abnormal.

friction-cones, *s. pl.*

Mach.: A form of friction-coupling in which the connecting portions have respectively a conical disc and a hollow cone, which become frictionally adherent by contact.

friction-coupling, *s.*

Mach.: [FRICTION-CLUTCH.]

friction-gear, friction-gearing, *s.*

Mach.: Wheels for transmitting power by means of parallel ridges or teeth of the driver on the rims which gear into corresponding grooves on the follower. They are very convenient for use in machines that require to be put in or out of gear rapidly; compressed masses of paper are also used as frictional driving surfaces.

friction-powder, *s.* [FRICTION-PRIMER.]

friction-primer, *s.*

Ord.: A small brass tube filled with gunpowder, and having a smaller tube containing friction composition inserted at right angles near the top. The composition is ignited by means of a rough wire inserted in the smaller tube, which is rapidly drawn out by a lanyard having a hook at the end. The composition consists of two parts sulphuret of antimony and one part chlorate of potassa, moistened with gum water and dried.

friction-pulley, *s.*

Mach.: [FRICTION-CLUTCH.]

friction-rollers, *s. pl.*

Mach.: A bearing formed of two rollers, whose circumference supports a rotating axle instead of a bush or block, in order to substitute the friction of rolling for that of sliding, which is considerably less for similar pressure. Similarly, cylinders, or round logs, are commonly placed under heavy weights, which have to be moved any short distance along the ground, so as to diminish the friction.

friction-tube, *s.*

Ord.: A tube containing a composition which is ignited by friction, and which is placed in the vent of a gun to fire the charge when the lanyard is pulled. [FRICTION-PRIMER.]

friction-wheel, *s.*

Mach.: A wheel, the motion of which is caused by the friction of a moving body, or, conversely, which communicates motion to a body by frictional contact. In one variety, one wheel being driven becomes a motor to the other, their perimeters being in contact. The surface is usually clothed with leather, rubber, or some sufficiently elastic material which does not polish too readily, and thus induce slipping. By grooving the perimeters of the wheels, the contact may be made more intimate, as the surface engaged is increased, and the elastic material of the respective faces caused to bind. In another form a collar fastened to the central shaft has four pivoted arms. When the rim turns in one direction, the arms turn on their pivots, leaving the rim and failing to transfer the motion to the shaft. When the rim turns in the contrary direction, the arms catch against it and are rotated by the contact, turning the shaft also. Another form has an upper india-rubber wheel with a V-edge, clamped between two metallic plates. By screwing up the nut which holds the parts together, the disc is made to expand radially, and thus increase the tractive power on the lower driving-wheel. The term friction-wheel is often, but erroneously, applied to wheels which diminish friction; these are properly called anti-friction wheels.

fric-tion-al, a. [Eng. *friction*; -al.] Of or pertaining to friction; produced by or resulting from friction.

frictional electricity, *s.*

Elect.: Electricity developed by rubbing bodies, as distinguished from dynamic electricity, that developed by means of a voltaic pile or battery. [ELECTRICITY.] (Ganot.)

Mach.: [FRICTION-WHEEL.]

† *Friends of the People*:

Hist.: A society formed in London in 1792 to advocate reform.

† *Society of Friends*:

Ecclesiast. & *Ch. Hist.*: A religious sect, better known as Quakers, which, however, is a nickname. [QUAKER.] Their founder was George Fox, an illiterate man, but of considerable natural ability, born at Drayton in Leicestershire, England, in July, 1624. He was apprenticed to a shoemaker, but could not settle steadily down to any secular occupation, the whole bent of his mind being toward religion. In 1647, at the age of twenty-three, he first began to preach independently of all other denominations, and by the following year had gained many adherents. When he went to the church of an ordinary clergyman, he had at first no scruple in rising to correct what he deemed erroneous in the doctrine of the preacher. Three instances of this are recorded, all of date 1649. In later years Fox did not disturb public worship. He professed to be commanded by the Lord not to use the ordinary forms of salutation, and to substitute "thee" and "thou" for the more courteous "you" in conversation. He deemed it sinful to take oaths (those of supremacy and allegiance, for instance), or to pay or sanction the payment by his followers of tithes, and thus naturally encountered vehement hostility from both the civil and ecclesiastical authorities. The rougher section of the common

people were also his foes. But he unflinchingly propagated his opinions in England, on the continent of Europe, and in America till his death, on Jan. 13, 1691. The Friends, like their originator, had much to suffer, and nobly bore their trials. In the reign of Charles II., Robert Barclay, a Scotch knight, was a zealous follower of Fox. In that of James II., William Penn, the founder of Pennsylvania, with its capital, Philadelphia, high in the favor of the king, procured them some toleration. After the revolution of 1688 the sect was not molested, and by 7 & 8 William III., c. 34, were allowed to make a solemn affirmation instead of an oath. They have since rendered services to the cause of education, of liberty, and of humanity. They hold the Divinity of Christ, His atonement, and other doctrines generally called evangelical. They give the title of the Word of God to Christ alone, and not to the Scriptures. They hold that every man coming into the world is endowed with a measure of light, grace, or good Spirit of Christ. They are opposed to all forms in worship, which divert the attention of the mind from the secret influence of the union from the Holy One. They believe that the ministry should be unpaid, and decline to pay tithes. They believe the sacraments of baptism and the Lord's Supper to be shadows and unnecessary now that the substance has been attained. They are opposed to taking oaths and war. They disown the heathen names of the days of the week, the observance of times, vain amusements, and compliments. For many years the Friends, both male and female, affected a peculiar style of dress of extreme plainness of shape and color, but this custom has been gradually discontinued.

¶ (1) **Friendly societies:** Societies formed with the view of assisting any one of their members who may be sick, infirm, or old, or who may have to meet the expense of a funeral in his family; or for providing a certain amount of support for his widow and family on his death. To obtain money for those objects, there is a fixed scale of contributions binding on all the members. Friendly societies existed among the Anglo-Saxons. It is doubtfully stated that one was founded in London in A. D. 1715. An Act for the encouragement of such institutions was passed in A. D. 1793. Many other Acts have since been passed to encourage friendly societies, and protect their members. These were consolidated into one by the Act 18 & 19 Vict. c. 63, passed in 1855, which has itself since been amended four times—viz., in 1858, 1866, 1875, and 1876. frigid zones, s. pl.

Math. & Geog.: The two cold zones or imaginary belts encircling the world. The former contains what mathematicians would call the small circle of the earth's sphere, having the North Pole for its center and the Arctic circle (23° 28' distant) for its circumference. Similarly the latter has the South Pole for its center, and the Antarctic circle (23° 28') for its circumference. Within these limits there is but one day and one night in the year, each nominally six months in duration, but the day is really considerably longer than the normal amount, owing to the influence of refraction in keeping the sun above the horizon. The intense cold of winter covers every land within the limits with glaciers and congeals immense expanses of every sea. The heat of summer, on the contrary, is much above what might be expected, for, though the solar beams are very oblique, yet, continuing for half a year without intervals of night, they produce great effects. It is a geological problem how plants, now found fossil in the polar latitudes, managed to pass undestroyed through the long winter. The *Frigid* is called also the *Frozen Zone*.

Zoölogy:

1. *Sing.*: The English name of the amphibious genus *Rana*, and particularly of the species *Rana temporaria*, or Common Frog. The genus *Rana* is distinguished from its congeners by having the tongue and tympanum distinct, the skin smooth, and the toes without claws; they are, however, pointed, and the hinder feet are united almost to the tips by a membrane. The species are numerous; they are widely distributed over the globe, many inhabiting tropical regions. The common frog is too well known to require description. It is found at the genial period of the year, burying itself at the approach of winter, in the mud at the bottom of ponds, and reappearing early in spring. In the month of March it lays its eggs, which are enveloped in a gelatinous material, in water, where they float. Each female deposits from six hundred to twelve hundred eggs a year. By April they have greatly increased in size and are becoming hatched. The immature frogs which come forth are called tadpoles. They have tails, no legs, breathe by gills, and are aquatic. Six or eight weeks later the legs are fully developed, the tail is absorbed, and they quit the water, remaining, however, in its vicinity to the last. The common frog is found in most parts of this country, in Europe, in the northern parts of Asia, and in the North of Africa. *Rana esculenta* is the Eatable frog, common on the European continent. *R. pipiens* is the Bull-frog of North America, and *R. clamitans* the Grunting or Argus Frog.

Fruitarian, *s.* [Eng. *fruit*, and suff. *-arian*.] Literally one whose food consists exclusively of fruits and nuts, those products of the vegetable kingdom which require neither cooking nor seasoning to become edible and palatable.

*The Natural Food Society of London, founded in 1890, is composed of fruitarians and is an offshoot from the vegetarians. Their distinct tenet is that man's natural food is composed of fruits and nuts, and that all bread, cereals, pulses and starchy vegetables are an unnatural and an unwholesome food. They hold that the nitrogen and fat or oil contained in the diet of civilization, and usually supplied by the flesh of animals and by milk and eggs, are naturally furnished by those nuts which require no cooking; but as such nuts are not usually easily obtained in good condition, and as they are not so easily digested as fish, flesh, milk, and eggs, by the great majority of people (owing to weakened powers of digestion, caused by wrong habits of living, and by inheritance) fruitarians recommend a diet based on fruit—dates, figs, bananas, oranges, raisins, grapes, apples, pears, peaches, apricots, nectarines, cherries, prunes, plums, berries, &c. (preferably fresh, but also dried and restored to a somewhat natural state by boiling water, or by gentle stewing)—and with enough flesh or animal products to supply the needed proportion of fat and nitrogen. The fruitarians have a considerable literature, and claim to rely chiefly upon the results of extended experiments for proof of their contention that bread—with all cereals and pulses—is the staff of death rather than life. They contend that all such foods, together with all potatoes and starchy vegetables, should be banished from man's dietary, and that the fruits named above should be substituted therefor. (*Dr. Emmet Densmore*.)

fúll-íng, pr. par., a. & s. [FULL (2), v.]

A. & B. As pr. par. & particip. adj.: (See the verb.)

C. As subst.: A process by which cloth made of a felting fiber is condensed, strengthened, and thickened, with a loss of width and length. [FELT.] In felting, the fibers—wool, for instance—slip past each other, and their toothed edges interlock, so that a continuation of the process causes them to be more and more intimately associated. The cloth is folded or rolled, and treated with soapy water. It is then beaten with wooden mallets, by which the serrated edges are forced past each other and the fibers closely commingled. Precautions are taken in some cases to prevent adherence of the folds of cloth by felting together. For this purpose cotton cloth is sometimes put between the folds of woolen cloth. Fulling and felting are dependent upon the same principle. Felted cloth is made by associating the fibers, and is not woven. Woven cloth exposed to the fulling or felting action is said to be milled. Repetition of the process constitutes it double-milled or treble-milled, as the case may be. Each milling thickens and solidifies the cloth while diminishing its quantity.

fulling-mill, s. A mill for fulling cloth. The modern fulling-mill consists of an iron framework supporting the shanks of heavy wooden mallets, which are raised by projecting cams on a tappet wheel. The mallets being raised to their full height are released, and drop by gravity on the cloth, which is contained in an iron trough beneath. Soap is added as a detergent, grease in any form tending to mar the felting action of the fibers. The end of the trough is curved, so that the cloth is turned round and round by the action of the mallets.

"By the large hammers, like those used for paper and fulling-mills, they beat their hemp."—Mortimer: *Husbandry*.

fúl-min-áte, s. [FULMINATE, v.]

Chem.: A salt of Fulminic acid (q. v.).

Fulminate of mercury: Mercuric fulminate, fulminating mercury. It is prepared by dissolving one part of mercury in 12 parts of nitric acid; the solution is mixed with an equal volume of alcohol when cold. The mixture is then gently heated on a water-bath. Red vapors are given off of nitrogen oxides and CO₂, and a large quantity of nitrous ether, aldehyde, and other products. When the liquid becomes turbid it is allowed to cool, and the salt separates out; it is purified by recrystallization from boiling water. It forms white needles, which, when heated to 186°, explode, also by friction or percussion when dry. It is used for charging percussion caps; one kilogram of mercury will make fulminate sufficient for 40,000 caps. Fulminates have been regarded as methyl cyanide in which one atom of hydrogen has been replaced by NO₂, and two atoms of hydrogen by mercury or silver. The action of chlorine on mercuric fulminate under water forms chloropieric, CCl₃(NO₂), mercuric chloride HgCl₂, and cyanogen chloride CnCl. Hot nitric acid decomposes mercuric fulminate, yielding carbonic acid, acetic acid, and mercuric nitrate. Hydrochloric acid converts it into mercuric chloride and mercurous oxalate. When boiled with an aqueous solution of potassium chloride, it is converted into potassium fulminate.

Fulminate of silver is obtained by heating nitrate of silver with strong nitric acid and alcohol till the liquid boils up. It is very dangerous to prepare. It crystallizes in small, white, opaque needles; it is very poisonous, and explodes by friction or percussion, or when heated. It is soluble in aqueous ammonia, and deposits the fulminate unaltered. When silver fulminate is digested with water and metallic copper or zinc, the silver is replaced and copper fulminate or zinc fulminate is obtained. When fulminate of copper is mixed with ammonia, and a stream of H₂S gas is passed through the solution, the copper is completely precipitated, and the filtered solution contains hydrosulphocyanic acid and urea.

Fulminate of gold was discovered by a monk in the fifteenth century. This substance, which explodes more rapidly and with greater local force than gunpowder, is made by precipitating a solution of chloride of gold by an excess of ammonia.

This portion of the glass is generally covered with an insulating layer of shellac varnish. One of the sheets of tinfoil is connected with a ring on the frame by a strip of tinfoil, while a chain from it unites it with the ground. To charge it, its insulated side is connected with an electrical machine. If then the knob of the discharger is pressed against the lower surface of the frame while the other knob is brought near the upper coating, an electric spark will be emitted.

fúl-min-úr-ic, a. [English *fulmin* (ic); -uric (Chem.).]

fulminuric-acid, s.

Chem.: C₂H₃N₃O₃ Isocyanuric acid. It is obtained by decomposing the lead salt with H₂S gas or the silver salt with hydrochloric acid. It forms a crystalline mass soluble in hot water and in alcohol. By the action of a mixture of strong nitric and sulphuric acids, fulminuric acid is converted into trinitro-acetonitrile C(NO₂)₃CN.

fumaric acid, s.

Chem.: C₄H₄O₄, or $\text{C} \equiv \text{CO} \cdot \text{OH}$. A dibasic diatomic

acid, which occurs in Fumitory (*Fumaria officinalis*),
in Iceland Moss, and in species of Boletus. It
can be obtained by the dry distillation of malic
acid, when malic acid distills over, leaving fumaric
acid in the retort, and the crystalline mass is washed
with cold water to remove unaltered malic acid;
also obtained by heating malic acid for a long time
at 150°. It is formed when dibromosuccinic acid is
heated with potassium iodide solution; also by
heating with baryta the product obtained by the
action of Cl₂ on benzene C₆H₆. Fumaric acid
crystallizes in colorless prisms, which are only
slightly soluble in cold water, soluble in hot water,
alcohol, and in ether. It sublimates at 200°, but a
great part is converted into water and maleic anhy-
dride. Fumaric acid is converted by sodium amal-
gam into succinic acid, HO·OC·CH₂·CH₂·CO·OH. It
forms acid, and neutral salts, the silver salt,
C₄H₂O₄Ag₂, is insoluble in water. It forms ethers;
methyl fumaric ether, C₄H₅O·CO·O·CH₃, forms
white crystals, which melt at 102°, and boil at 192°;
the ethyl ether is a liquid boiling at 218°. Fumaric
acid, dissolved in water, unites with metallic zinc,
forming succinate of zinc.

fumaric aldehyde, s.

Chem.: C₄H₄O₃, or $\text{CH} \equiv \text{CO} \cdot \text{H}$. It is formed by

the action of chromic acid on pyromucic acid, with
liberation of CO₂; also by the action of two mole-
cules of bromine and water on pyromucic acid,
C₅H₄O₃ + 2H₂O + 2Br₂ = C₄H₄O₃ + CO₂ + 4HBr. It is a
syrup, which crystallizes with difficulty. (*Watts:*
Dict. Chem.)

fu-mār'-ī-mide, s. [English fumari(c), and
(a)mide.]

Chem.: C₄H₂O₂·NH. Obtained when acid malate
of ammonium is heated to 200°. The red powder is
exhausted by maceration in boiling water, and the
liquid deposits a white powder of anhydrous
fumarimide. When boiled for a long time with
hydrochloric acid, it yields inactive aspartic acid,
C₂H₄(NH₂)·CO·OH.

fūm'-ar-lne, s. [Eng., &c., fumari(a), and suff.
-ine (Chem.) (q. v.).]

Chem.: A base obtained from *Fumaria officinalis*.
It crystallizes in irregular six-sided prisms, soluble
in alcohol, chloroform, and benzene, insoluble in
ether, and sparingly soluble in water. The solution
is bitter, and gives an alkaline reaction; with
strong sulphuric acid it gives a dark violet liquid.
Its salts are crystalline.

furfuracrylic-acid, *s.*
Chem.: $C_5H_4O_2 \cdot CH=CH \cdot CO \cdot OH$. Metamerism with salicylic acid. It is obtained by boiling one part of furfural with four parts of acetic anhydride and two parts of sodium acetate for eight hours. The solution on cooling deposits a crystalline mass which dissolves in sodium carbonate, and on the addition of acid gives a precipitate of furfuracrylic acid which is obtained in white needles by recrystallization with animal charcoal. It melts at 135°. Strong sulphuric and hydrochloric acids turn it green.

fūr-fu-rāl, *s.* [Latin *furfur*=bran, and Eng., &c., *aldehyde*.]

Chem.: $C_5H_4O_2$ or $HO-C \equiv C-CO \cdot H$. Furfural, the aldehyde of pyromucic acid. It is formed in the dry distillation of sugar, or by distilling bran with dilute sulphuric acid. One part of bran is distilled with one part of sulphuric acid diluted with three parts of water. The distillate is neutralized with soda, chloride of sodium is added, and then half of it is distilled over. It is then saturated with NaCl, which causes the furfural to separate as an oil. Furfural is a colorless liquid with an agreeable smell, resembling that of bitter almonds; it turns dark on exposure to the air; it boils at 162°; is very soluble in alcohol, and dissolves in eleven parts of water at 13°. It forms a crystalline compound with acid sodium sulphite, and is converted by sodium amalgam into furfuryl alcohol, $C_5H_5O_2$. By oxidation with silver oxide it yields pyromucic acid, and by nitric acid it is oxidized into oxalic acid.

fūr-fūr-a-mide, *s.* [Lat. *furfur*=bran, and Eng., &c., *amide*.]

Chem.: $C_{15}H_{12}N_2O_3$, or $(C_5H_4O)_3 \cdot 3N_2$. An amide produced by the action of an aqueous solution of ammonia on furfural. It crystallizes from hot alcohol in colorless needles, which melt at 117°. It is soluble in alcohol and in ether, but insoluble in cold water. When boiled with water, or with acids, it is decomposed, yielding furfural and NH_3 .

It is sparingly soluble in cold water, easily soluble in alcohol and in ether. Its solution is strongly alkaline, and forms salts with acids, which have a bitter taste.

fūr-fu-rō-bēn-zl-din, *s.* [Eng. *furfuro*(l), and *benzidin*.]

Chem.: $C_{12}H_8(N \cdot C_6H_4)_2$. Obtained by allowing a solution of one part of furfural and one part of benzidin in fifty parts of alcohol stand for twelve hours. It forms small light yellow crystals which are insoluble in water, slightly soluble in cold alcohol, soluble in benzene. Unites with acids to form salts which, in solution, are of a carmine-red color.

It is extracted by ether from its aqueous solution, and is a colorless crystalline mass, melting at 51°. Hydrochloric acid turns it yellow.

fûse (1), s. [A shortened form of *fusee* (2) (q. v.).] A tube or casing filled with combustible material, and used for igniting a charge in a mine or a hollow projectile. The invention was undoubtedly contemporaneous with that of hollow projectiles. The following are the principal varieties of fuses in use:

(1) The *Bickford-fuse*: Used for mining and submarine purposes. It consists of a small linen tube filled with gunpowder, the whole being covered with pitch. It burns at the rate of one yard in seventy seconds.

(2) The *Blasting-fuse*, used in mining and quarrying. It is filled with a slow-burning composition, allowing time for the operatives to reach a place of safety before it burns down to the charge. It is also used for submarine blasting.

(3) The *Combination-fuse*, for hollow projectiles, comprises a time-fuse and a percussion or concussion-fuse united in the same case. The former is designed to explode the charge in case the latter fails to act on striking. Another form is that in which the time-fuse explodes the percussion-fuse. This variety is used with such explosives as dynamite and gun-cotton.

(4) The *Concussion-fuse*, for hollow projectiles; designed to explode the charge when the shell strikes an object.

(5) The *Delayed-action-fuse*, for use with common shell against earthworks. It causes the projectile to explode four seconds after impact.

(6) The *Electric-fuse* is one adapted to be ignited by the passage of an electric spark through it.

(7) The *Percussion-fuse* embraces a capsule charged with fulminate, which is exploded by a plunger or its equivalent, when the projectile strikes. The plunger is held by a pin sufficiently strong to keep it in place in case of a fall, yet weak enough to be severed by the shock of striking.

(8) The *Safety-fuse* is a cord or ribbon-shaped fuse filled with a fulminating or quick-burning composition, and sufficiently long to be ignited at a safe distance from the chamber where the charge is placed.

(9) The *Tape-fuse* is a safety-fuse, so called from its shape.

(10) The *Time-fuse* is one which is adapted either by cutting off a portion of its length or by the character of its composition to burn a certain definite time.

fuse-cutter, s. An instrument for gauging time-fuses to the desired seconds and fractions.

fuse-extractor, s. An implement designed for extracting wooden fuses from shells. It has jaws which grasp the fuse while the lower part of the extractor rests upon the shell. The jaws are attached to a screw, which works in a screw-socket in the body of the extractor, and has an iron lever passing through its head. The jaws being clasped around the projecting part of the fuse, it is drawn by turning the lever.

fuse-lock, s.

Min.: A spur on the spring attaches the lock to the fuse when the hammer is set. The dog is pulled by a long cord from a distant position of safety, releasing the hammer, which explodes the cap and lights the fuse.

fuse-saw, s. A tenon-saw used by artillery-men.

Hor.: A conical pulley used in connection with a spring, and designed to equalize the power of the latter. The spring is coiled within the barrel, and when fully wound up and at its greatest tension, the chain is wound upon the fusee and draws upon its smaller portion. As the fusee unwinds, by the motion of the train of gearing in the watch, the spring also uncoils and loses a part of its tension; as this proceeds, the chain draws upon a larger portion of the fusee, and attains an increased leverage on the latter to counterbalance the decreased power of the spring. The object is to obtain an equal power at all times, so that the watch may run regularly. The first wheel of a watch is attached to the fusee.

fusee-engine, s.

Hor.: A fusee-machine (q. v.).

fusee-machine, s.

Hor.: A machine for cutting the snail-shaped or spirally grooved wheel on which the chains of certain descriptions of watches are wound. It was invented by Dr. Hooke about 1655. future-life, s.

I. *Ord. Lang.*: In the same sense as II.

II. *Composition*:

Relig.: A life to succeed this one; a life beyond the tomb.

(1) *Ethnic faiths*: The belief in a future-life is very widely spread, many observers who have denied that it is entertained among certain tribes indirectly confuting themselves by the facts which they put on record. In its early form no distinction is drawn between the souls of men and brutes; for both another state of existence is reserved. In the lowest form of Animism, a figure of a deceased friend appearing to a survivor in a dream is supposed to be the actual soul of the person dead, whence faith in another state of existence becomes natural and easy. Two distinct forms of belief now diverge, the one leading in the direction of the transmigration of souls (q. v.), the other maintaining the independent existence of the personal soul after the death of the body. Among the lower races, the moral element in the doctrine of a future-life is almost wholly wanting. (*Tylor.*)

(2) *Judaism*: There are but few allusions to a future-life in the Old Testament. The most notable one is, "And many of them that sleep in the dust of the earth shall awake, some to everlasting life, and some to shame and everlasting contempt. And they that be wise shall shine as the brightness of the firmament; and they that turn many to righteousness as the stars forever and ever" (Dan. xii. 2, 3), in which the doctrine seems to be not simply the immortality of the soul, but the resurrection of the body. [(3)]

(3) *Christianity*: "Jesus Christ," says St. Paul, "hath abolished death, and hath brought life and immortality to light through the gospel" (2 Tim. i.). The doctrine in this case is not merely that of the immortality of the soul, not transmigrated, but retaining its separate individuality [IMMORTALITY]; there is superadded to this the resurrection and transformation of the body. [RESURRECTION.] The moral element in the doctrine of a future-life is here all in all.

Comparative Religions:

1. *Ethnic*: This symbol, like the cross of which it is in all probability a modification, is confined to no one religion, but is common to the great majority. In India the well-known sign of the fylfot is the Swastika of the Buddhists; in Greece we find it as stamped on coins and painted on urns; on the breast of an Etruscan sphinx it assumes a shape like the arms of Man, with a fourth leg added; four different forms of it are found on as many cinerary urns discovered under a bed of volcanic tufa on the Alban Mount; again we meet with it as the cruciform hammer of Thor, and sculptured on Runic monuments. In some of its forms it resembles the *cruz ansata* of the Egyptians, and it was in use among the early inhabitants of South America. When the fylfot occurs in Asia Minor, Greece, Etruria, or Latium, it is probably connected with some system of phallic worship; but it has not, in all cases, a religious significance. Greenwell, speaking of pottery ornamented with crosses found in British barrows, considers this pattern to be the natural result of dividing a given space into four equal parts, though in one case, he says, the marking "almost assumes the form of the fylfot." Dawkins (*Early Man in Britain*) figures pottery marked with this emblem, and says of the pottery of the late Bronze Age in France, that "sometimes it is ornamented . . . with the mystic fylfot" (p. 389).

*fŷyre, s. [Middle Eng. *fŷyre*=fire.] The Star-bistle. (*Prompt. Parv.*) (*Britten & Holland.*)

fäte, fät, färe, amidst, whät, fäll, father; wē, wēt, hēre, camēl, hēr, thēre; pine, pīt, sīre, sīr, marīve; gō, pōt, or, wōre, wōlf, wōrk, whō, sōn; mūte, cūb, cūre, unite, cūr, rūle, fūll; trŷ, sŷrian. æ, œ = ē; ey = ā. qu = kw.

THE seventh letter and fifth consonant of the English alphabet, is formed by arching the tongue against the hinder part of the roof of the mouth, then lowering the tongue and giving utterance to voice. *G* has two sounds in English, one *hard* when it occurs before *a*, *o*, *u*, as in *gate*, *god*, *gun* (except in *gaol*), and when initial, always before *e* and *i* in all words of English origin, as in *get*, *give*, and when final, as in *bag*; as also before the consonants *l* and *r*, as in *glove*, *grove*; the second sound of *g* is *soft*, and is a palatal sound like *j*. This second sound of *g* was unknown in Anglo-Saxon. It is the voiced sound corresponding to the breathed sound of *ch* as in *church*. It is the sound which *g* has commonly before *e*, *i*, and *y*, as in *gem*, *gin*, *gymnastics*. *G* is silent before *n*, as in *gnat* when at the beginning of a word, and at the end of a word it generally serves to lengthen the vowel, as in *benign*. In form *G* is a modification of *C*, which in the Roman alphabet had the same power. The A. S. *g* is in many words now represented by *y*, as in *may* (verb), *way* (A. S. *wæga*), or *w*, as in *law* (A. S. *lagu*), *dawn* (A. S. *dagian*). Sometimes it has been softened down to *a*, *e*, or *i*, as in *alike* (A. S. *gelic*), *enough* (A. S. *genoh*), *handiwork* (A. S. *handgeweorc*). Sometimes it is lost in the root, and makes its appearance in the derivative as in *dry* and *drought*, *slay* and *slaughter*, &c. From some words it has disappeared altogether, as in *if* (A. S. *gif*), *ice* (A. S. *isgicel*), &c. It has been softened to *g* (=f), as in *cringe* (A. S. *cringan*), and to *ch* in *orchard* (A. S. *ortgærd*). In Romance words *g* often disappears, as in *master* (Lat. *magister*). It has crept into some words (generally from false analogy), as in *sovereign*, *foreign* (O. Fr. *souverain*, *forain*). *Ec*, *eg* has often become *g* (=f), as in *edge* (A. S. *ecg*, *egg*). *Gh* has a guttural sound, as in *tough*, the sound of *f*, as in *tough*, and in many words is not sounded, as in *bright*, *plough*.

Thirty-five parts of dried milk yield one part of galactin, which is soluble in water, insoluble in alcohol and ether. It is precipitated by tannin, but differs from gelatine in redissolving at 60°. Galactin emulsifies fat. It is found in the blood, gastric juice, animal membranes, milk, eggs, and many morbid animal fluids. † *St. Paul's Epistle to the Galatians*:

Scripture Canon: A New Testament Epistle, stated in ch. i. v. 1 to have been written by the Apostle Paul, a claim admitted by the ancient church universally, and by nearly all the ablest modern critics. It is one of the four epistles considered by Ferdinand Baur as genuine. St. Paul, who generally, it appears, used an amanuensis, wrote this epistle with his own hand (vi. 11). It was penned just after a visit by the apostle to the Galatian church (i. 6). Two such visits had taken place; the first, during which he founded the Galatian church, was about A. D. 51 or 50 (Acts xvi. 2); the second was about A. D. 55 (Acts xviii. 23). In ch. iv. 16 a first visit is alluded to, implying that there had been a second. The epistle, then, was not penned till at least A. D. 55, and probably not until A. D. 57 or 58, during the first part of the Apostle's residence at Ephesus (xix. 10). The subscription at the end of the epistle which shows that it was written from Rome, though accepted by Baur, is rejected by most critics. The Galatian church consisted mainly of Gentile converts. On these Paul did not impose the yoke of the Mosaic ritual, though he was willing to tolerate its use among the Jewish proselytes. No sooner had he departed, however, than Judaizing teachers appeared in the Galatian church, represented that Paul was not on a level with the Apostles originally chosen, but a mere subordinate agent whom they had sent forth; that his teaching with regard to the law of Moses was in conflict with that of Peter, and that circumcision was indispensably necessary to salvation. In reply to these teachers, Paul showed that he was a real Apostle (i. 15, &c.), and that he met the other apostles on such a footing of equality, that on one occasion he had withstood Peter to the face when he was to be blamed (ii. 11-14, &c.). He reproaches them for their fickleness in so quickly turning from the pure to the perverted gospel (i. 6-9; iii. 1, &c.), exhorts them not to relapse from Christian liberty into the bondage of Judaism (iii. iv., v.), and concludes with practical exhortations (vi.).

1. *Ordinary Language*:

1. *Lit.*: In the same sense as II.

"The galaxy, that milky way

Which nightly, as a circling zone, thou seest

Powdered with stars." *Milton: P. L.*, vii. 579.

2. *Fig.*: An assemblage of splendid persons or things.

"The crowded, yet clean and luminous galaxies of imagery, diffused through the works of Bishop Taylor." —*Dr. Parr. (Latham)*

II. *Astron.*: The Milky Way. It constitutes nearly a great circle inclined to the equinoctial at an angle of about 63°, and cutting that circle in right ascension 0h. 47' and 12h. 47', so that the northern and southern poles are situated, the one on right ascension 12h. 47', declination N. 27°, and right ascension 0h. 47', declination S. 27°. The milky appearance of the great belt or zone now described arises from the blended light of countless multitudes of stars, each doubtless a sun to some system of planets. Sir Wm. Herschel estimated that at one portion of the Milky Way 116,000 stars passed through the field of the telescope in a quarter of an hour, and on another occasion 258,000 stars in forty-one minutes. Here and there the Milky Way divides, especially at one spot, where there is a separation into two portions, somewhat resembling

the projecting sides of a fishtail. Sir W. Herschel believes that stars are not scattered at tolerably uniform intervals through space, but are congregated at particular spots. The solar system is in a stratum of stars, the thickness of which is inconceivable compared with its length and breadth. The sun is situated near the middle of the stratum, in proximity to the front, where it subdivides into two streams. Looking laterally to the right or left one sees out of the marching regiment of stars into comparatively vacant space, but looking forward or backward the front or rear can be seen blended together so as to constitute the appearance called the Milky Way. Among other colloquial names given to the Galaxy are Jacob's Ladder, the Way to St. James', Watling Street (London), &c.

1. *Phar.*: A gum resin obtained from an umbelliferous plant, *Ferula galbaniflua*. It is imported from Persia and India. It occurs in translucent masses of brownish yellow agglutinated tears, which have a peculiar smell, and a bitter acid taste. It yields when distilled with water about seven per cent. of a volatile oil, having the formula $C_{10}H_{16}$, boiling at 160°; the residue, after boiling with milk of lime, and then precipitating the filtrate with hydrochloric acid, yields yellow resin, soluble in alcohol and ether. When the alcoholic solution of this resin is saturated with hydrochloric acid gas it yields umbelliferone. The purified resin yields by destructive distillation a blue oil, which boils at 289°, and has the formula $C_{20}H_{30}O$. It is said to be identical with the blue oil obtained from chamomile. Galbanum fused with caustic potash yields resorcin $(C_6H_4(OH)_2)$ (1-3). Galbanum is used to prepare *Emplastrum galbani*, and is given internally as a stimulating expectorant.

2. *Script.*: The translation, *galbanum*, in Exod. xxx. 34, is probably correct. It was one ingredient in the holy anointing oil.

gāl (2), *s.* [O. Fr. *galle*, from Lat. *galla* = a gall-nut; Dut. *galmort*; Fr. *gale*, *noix de gale*; Ital. *galla*; Ger. *gallapfel*.]

I. Ordinary Language:

1. **Gen. (Bot.:** A morbid excrescence on the leaf or leaf-bud of any plant, arising probably from the puncture of a cynips. These small hymenopterous insects deposit their eggs on the leaves, &c., of various plants, each species being limited to a single plant, or even a single part of one; thus there is a *Cynips ficus caricae* on the common fig, a *Cynips fagi* on the beech, and a *Cynips quercus folii* on the leaves of the common oak. The so-called oak-apples are not fruits but morbid excrescences produced by *Cynips terminalis*, so called because it deposits its eggs at the extremity of the shoots on the tree. Some galls have at times been mistaken for fungi, but proper care can distinguish between the two.

2. **Spec. (Bot. & Comm.:** The galls of commerce are produced by the puncture by *Cynips galle tinctoria* of the leaf-bud of *Quercus infectoria*, or more rarely of some other species of oak. In the hole made by the insect, an egg is deposited, in due time to be developed into a larva, which eats its way out when it comes to the perfect state. One variety is white or yellow, another green, gray, or black. The best galls come from Smyrna and Aleppo. With the salts of iron they yield a fine black color, and are used in the manufacture of ink.

"The *Galle* galls, wherewith we make ink, are no other than cases of insects, which are bred in them."—Derham.

II. Pharm.: Galls are used in pharmacy for the preparation of Gallic acid (q. v.). Official preparations of gall-nuts are *Tinctura galle* (tincture of galls), *Unguentum galle* (ointment of galls), and *Unguentum galle cum opio* (ointment of galls with opium). Gall-nuts are useful on account of the Tannin (q. v.) and gallic acid contained in them. Tannin is a powerful astringent, and is useful in affections of the alimentary canal, also applied locally to suppress hemorrhage from the gums, lips, nose, &c. Preparations of gall-nuts should not be given with salts of iron, infusions and decoctions containing alkaloids, salts of lead, antimony, &c., nor with gelatine, as these substances give precipitates with tannic acid.

gallic acid, *s.*

Chem.: $C_7H_5O_5 + H_2O$ or $C_6H_2(OH)_3 \cdot CO \cdot OH + H_2O$. Trioxibenzoic acid. Gallic acid occurs in several plants, as Sumach, *Dividivi*; in the leaves of *Arctostaphylos uva ursi*; in the roots of *Helieborus niger*, *Veratrum album*, *Colchicum autumnale*, *Cephaelis ipecacuanha*; in the bark of *Strychnos nux vomica*; in red wine, &c. Gallic acid can be prepared synthetically by fusing di-iodoxybenzoic acid with caustic potash. It is also formed by powdering gallnuts, which contain tannin, and exposing them moistened to the air for a month, at a temperature of 70°, and is then extracted with boiling water, the crystals redissolved in boiling water, and decolorized by animal charcoal. The spores of *Pencilium glaucum* convert tannin into gallic acid. It is also prepared by boiling tannin with dilute sulphuric acid, which converts the tannin into gallic acid and glucoside, $C_7H_5O_5 + 4H_2O = 3C_6H_5O_5 + C_6H_{12}O_6$. Gallic acid crystallizes in white, silky needles, which lose their water of crystallization at 120° and melt with decomposition at 222° to 240°. Soluble in three parts of boiling water, and in 130 parts of water at 12°; also soluble in alcohol and in ether. Pure gallic acid does not precipitate gelatine, albumen, or alkaloids. It gives a bluish-black color with ferric salts; soluble in excess of Fe_2Cl_6 . Dry gallic acid heated to 210° gives off CO_2 , and yields pyrogallol, $C_6H_2(OH)_3$. By the action of nitric acid it is oxidized to oxalic acid. Gallic acid forms salts which are called gallates. Dry gallic acid triturated in a mortar with potassium permanganate, takes fire, and gives out sparks. Gallic acid has a sour, astringent taste. It reduces gold and silver salts, and is used in photography. It is a monatomic acid, and also a triatomic phenol; therefore, four atoms of hydrogen can be replaced by metals. Gallic acid is sometimes used in medicine instead of tannin.

This was suspended in 1516 by the Concordat with Leo X., which was less favorable to the Gallican Church. On March 12, 1682, the French clergy issued a declaration that the Papal authority in France is limited to spiritual matters, and that it is subject to the decision of a General Council. This manifesto was condemned by successive Popes in 1682, 1690, 1706, and 1794.]

gāl-līt-zēn-lō, s. [GALLICINITE.]

gāl-lī-ūm, s. [*Gallia*, in honor of France.]

Chem.: Gallium, a metallic element, symbol Ga, atomic weight 69.9. Gallium is a triad element. Specific heat 0.079. It was discovered by a French chemist, Lecoq de Boisbaudran, in zinc blende; but Mendeleeff had shown in his periodic law that an element must exist having intermediate properties between aluminum and indium; he called this supposed element ekaaluminum. The metal is obtained by dissolving the blende in sulphuric acid and placing in the solution plates of zinc till the disengagement of hydrogen becomes slow, but is still perceptible, by which means the greater portion of the copper, lead, cadmium, iridium, thallium, silver, mercury, selenium, arsenic, &c., contained in the ore is precipitated; the clear filtered liquid is then heated with a large excess of zinc, the resulting gelatinous precipitate, consisting chiefly of alumina, basic salts of zinc, and gallium, is redissolved in hydrochloric acid, and again heated with zinc, which gives a precipitate, in which the gallium is more concentrated. This precipitate is redissolved in hydrochloric acid, the solution is treated with hydrogen sulphide, and the filtered liquid, after expulsion of the H_2S , is fractionally precipitated with ammonium carbonate, till the solution of the resulting precipitate in hydrochloric acid no longer gives any indication of the presence of gallium when examined by the spectroscopic. The precipitates are collected and dissolved in sulphuric acid, and cautiously evaporated till the free sulphuric acid is expelled; the residue when cold is digested with water till it is dissolved, the nearly neutral solution is boiled, the basic gallium sulphate is precipitated and filtered while hot, and then dissolved in a small quantity of sulphuric acid, treated with excess of potash till the precipitate is redissolved, and then precipitated by a stream of CO_2 . Finally the gallium oxide is redissolved in the smallest quantity of sulphuric acid, the solution mixed with excess of slightly acid ammonium acetate, then H_2S gas is passed through the liquid; the filtered acetic solution is diluted with water, and heated to boiling, whereby the greater part of the gallium is precipitated as oxide; this precipitate is filtered off hot, washed with boiling water, and redissolved in sulphuric acid, and the solution mixed with a slight excess of potash, and filtered, whereby a pure alkaline solution of gallium is obtained. Metallic gallium is obtained by the electrolysis of this alkaline solution, platinum electrodes being used, and the positive electrode being larger than the negative on which the metallic gallium is precipitated, which is detached by dipping the platinum plate in warm water and bending it backward and forward. Gallium is a silver-white metal, which melts at 30° , but remains liquid for weeks at 0° . Cooled to -15° it crystallizes. Gallium is a hard metal, very slightly malleable, and leaves a bluish-gray trace on paper; when melted it adheres to glass; it does not tarnish in the air. Its specific gravity is 5.95. It gives a brilliant violet line in the spectrum. When heated in the air it oxidizes on the surface, and does not volatilize. It dissolves in hydrochloric acid with disengagement of hydrogen. It is scarcely attacked by nitric acid in the cold; when heated it dissolves slowly with evolution of nitrous fumes. It forms salts.

gallium-salts, s. pl.

Chem.: Gallium-salts are precipitated by ammonia. If redissolved by hydrochloric acid, and again precipitated by ammonia, the precipitate is soluble in excess. Potash gives a precipitate which is soluble in excess, sodium carbonate gives a white precipitate, an ammoniacal solution of gallium chloride, or sulphate, is precipitated by acetic acid; hydrogen sulphide does not precipitate gallium from slightly acid solutions; sulphide ammonium does not give a precipitate with the ammoniacal solutions of pure chloride or sulphate of gallium; if zinc is present the gallium is precipitated along with the zinc. Potassium ferrocyanide gives a yellow precipitate with strongly acid solutions of gallium chloride.

gallium-sulphate, s.

g  l-v  n-i-s  m, s. [Named after Aloysius Galvani, who was born at Bologna in 1737, published in 1791 his celebrated work, *Aloysii Galvani de viribus Electricitatis in Motu Musculari Commentarius*, and died in his native town in 1798.]

Physics: The branch of electric science to which an experiment by Galvani gave birth. His wife, who was making soup from frogs, happened to put them, after being skinned, in proximity to a charged electrical machine belonging to her husband. On touching them with a scalpel their legs became greatly convulsed. Galvani on his return was told what had occurred, and repeated the experiment on several occasions. He united the lumbar nerves of a dead frog with its crural muscles by a metallic circuit. He came to the erroneous conclusion that animal electricity existed in the nerves and muscles of frogs, &c. In this explanation Galvani ignored the metallic connecting wire. His contemporary, Volta, gave attention to this, and found that the contraction of the limbs is more energetic when the connecting arc is made of two metals instead of one. He therefore inferred that the metals took the active part in producing the contraction, and the disengagement of electricity was due to their contact, and that the animal parts constituted only a conductor, and at the same time a very sensitive electroscope. In 1793 he published these views, and in 1800 first described and constructed what has since been called after him the Voltaic pile. [PILE; see also BATTERY, B. III. 4.] Febroni, observing that the discs of zinc in the pile became oxidized in contact with the acidulated water, considered, as did Woolaston and Davy, that the oxidation was the chief cause why electricity was disengaged. Now Voltaic piles have nearly given place to Voltaic or Galvanic batteries, of which there are many varieties. [BATTERY, B. III. 4.]

Engraving: A process in which the ground is spread on a clean zinc plate and etched. Succeeding coats of varnish are spread by a roller on the ground, avoiding the obliteration of the lines, which become deeper with each coat. The finished plate becomes a matrix for a reverse impression obtained in the electro-bath, and this reverse is used to print from in the ordinary manner.

A copy of this is made by the electrolytic process; the darker being now the deeper portions, the whole forms an intaglio, like a copperplate, and is printed from by the copperplate-printing process.

Elect.: The same as Electromagnetic (q. v.).

g  l-v  n-  -  -t  r, s. [Pref. *galvano*-, and Gr. *metron*=a measure.]

Elect. Machine: A multiplier; a very delicate apparatus for determining the existence, direction, and intensity of currents. It was invented by Schweigger, in Germany, in 1819, just before  rsted, in Denmark, in the same year, discovered the law of directive action, which a fixed current excites at a distance on a magnetic needle. In connection with the construction of the Indicator telegraph (q. v.), Amp re, Arago, Schilling, Gauss, Weber, Alexander, all used the principle, but it was carried out in a superior manner to any by Cooke and Wheatstone in 1837. The galvanometer consists of a magnetic needle suspended by a filament of silk, and surrounded in the plane of the magnetic meridian by a copper wire, forming a complete circuit round the needle in the direction of its length. The actions of the four branches of the circuit, give the North Pole the same direction. The coiling of the copper wire in the direction of the needle multiplies the current. By making several, though not an indefinite number of circuits, all insulated, the action of the instrument becomes more powerful, and the deflection of the needle greater. If there be two or three thousand turns of fine wire, with their coils carefully insulated by means of silk and shellac, currents of high intensity will be generated.

  (1) *Differential galvanometer*:

Elect. Mach.: An instrument designed to ascertain a difference in the intensity of two currents. It consists of a needle like that in an ordinary galvanometer, round the frame of which are coiled two wires of the same kind and size, completely isolated from each other, and with binding screws, so that separate currents can be passed through each of them. If the currents are of the same intensity, but in different directions, there is no deflection, but, where the needle is deflected, one of the two currents differs from the other.

(2) *Marine galvanometer*:

Elect. Mach.: A galvanometer designed to test the insulation of submarine cables, and at the same time unaffected by the pitching and rolling of the ship. It consists of several thousand coils of copper wire-insulating. In the center of the coil is a slide carrying the magnet; it is attached to a mirror of thinly silvered glass. A single fiber of silk is stretched across the slide; to this the mirror and magnet are attached in such a manner that the fiber exactly passes in every position through the center of gravity. The slide fits into a groove in the coil, and the whole is inclosed within a wrought-iron case, with the aperture in front, and a wrought-iron lid on the top. There are also an adjusting magnet and a scale.

***gām-bō ge (or gām-bō ge), s.** [A corruption of *Cambodia*, the name of the district in Annam, where it is found.]

1. **Chem.:** Gamboge, or camboge, is a gum resin containing about 70 per cent. of resin, and 24 per cent. of soluble gum. It is obtained by piercing the bark of *Garcinia morella*, var. *pedicellata*, a tree belonging to the order Guttiferae, growing in Cambodia, Siam, and the south part of Cochinchina. The juice is allowed to harden in bamboo reeds, hence it occurs in commerce in the form of pipes which are striated externally. Gamboge is hard and brittle, breaking with a yellow-brown vitreous conchoidal fracture; its powder is a bright yellow color; it is inodorous, has a slight taste, but when chewed is acid. When rubbed with water the gum dissolves, forming a yellow emulsion with the suspended resin. Gamboge is soluble in alcohol and in ammonia. The resin can be extracted by ether; it is a hyacinth-red color, and yields a yellow powder; it dissolves in alkalis with a deep red color; the resin fused with caustic potash yields phoroglucin, iso-uvitic acid, pyrotartaric acid, and an amorphous syrupy acid. Gamboge is used as a pigment in water-color painting. By the action of nitric acid it is oxidized into picric and oxalic acids. An inferior kind of gamboge in the form of flat cakes is prepared in Ceylon from *Hebradendron gambogioides*.

2. **Pharm.:** Gamboge is used in the preparation of *Pilula cambogice composite*, Compound Gamboge Pill, composed of gamboge, Barbadoes aloes, compound powder of cinnamon, hard soap, and syrup. Gamboge acts as a drastic hydragogue purgative, it causes vomiting and griping; it is seldom given alone, but combined with cream of tartar in cases of dropsy, or with calomel in cerebral disease. In large doses gamboge is a powerful irritant, causing inflammation of the alimentary canal, which may end fatally.

But the laws, called the game-laws, also inflicted additional punishments on persons guilty of this general offense, unless they were people of such rank or fortune as were therein particularly specified. It may affect an organ, such as the lung, but this is rare, or the soft tissues, which is common, particularly of the foot, especially in the aged, as senile gangrene. When part remains alive it is gangrene, when it is completely dead sphacelus. So in bone, caries and necrosis occur, the first as gangrene or incomplete, the second as sphacelus or complete death. Degeneration differs from gangrene in not becoming isolated or putrid, but, if not absorbed, remaining in continuity with surrounding parts. Gangrene of soft parts is usually termed sloughing. Necramia, or death of the blood, and sequestrum, or a dead piece of bone, are examples of gangrenous lesions.

Ichthy.: The name given by Agassiz to one of the four orders into which, chiefly for paleontological purposes, he divided the class of Fishes. It has since been adopted by Profs. Müller, Owen, Huxley, &c., but with certain modifications. The essential character of the fishes belonging to the order is that they have Ganoïd-scales (q. v.). These constitute the exoskeleton. The endoskeleton is cartilaginous instead of osseous. There are generally two pairs of fins; the first ray is usually a strong spine. The tail is generally heterocercal. The few living species are mostly freshwater, but marine forms must once have abounded. The ganoïds commenced at least as early as the deposition of the Upper Silurian Rocks, and have continued, though their relative importance is much diminished, till now. The order has been divided into:

Section 1.—Lepidoganoïde. Sub-orders: (1) Amiade; (2) Lepidosteidae; (3) Platyosomide; (4) Crossopterygide; (5) Acanthodide.

Section 2.—Placoganoïde. Sub-orders: (1) Ostracoste; (2) Chondrosteide.

gās, *s. & a.* [Dut. *gas*=a word introduced by the Flemish chemist, Van Helmont, who was born in A. D. 1577. Cf. Dut. *geest*=spirit.] [GHOST.]

A. *As substantive*:

I. Ordinary Language:

1. *Lit.*: In the same sense as II. 2.

2. *Fig.*: Empty talk; froth.

II. Technically:

1. *Chem.*: A gas is a substance possessing the condition of perfect fluid elasticity, and presenting under a constant pressure a uniform rate of expansion for equal increments of temperature, but when gases reach their maximum densities they behave like vapors. All gases can be condensed into liquids by cold and pressure. Some of the elements, as oxygen, hydrogen, nitrogen, chlorine, and probably

fluorine, are gases at ordinary temperatures. Atmospheric air is a mechanical mixture of 77 parts by weight of nitrogen, and 23 of oxygen, or 79 volumes of nitrogen mixed with 21 volumes of oxygen. Gases are formed by the dry distillation of animal and vegetable substances, which yield carbon dioxide, carbon monoxide, ammonia, nitrogen, hydrogen, sulphur dioxide, hydrogen sulphide, and hydrocarbons. Gases as carbon dioxide and hydrogen sulphide are given off during putrefaction; carbon dioxide during fermentation. Ordinary gas used for burning, &c., is prepared by the dry distillation of coal. [COAL-GAS.] Gases are prepared in the wet way by the action of mineral acids on different substances. The resulting gases may be collected: (1) by reception in an exhausted vessel; (2) by displacement of air, the delivery tube proceeding from the generating vessel is made to pass down to the bottom of the receiver placed with its mouth upward; this method is used for gases which are heavier than air, and are dissolved by water, as chlorine, &c.; (3) collection over liquids, generally mercury, or water; a jar or bottle is filled with the liquid and inverted over a trough filled with the same liquid, and the end of the delivery tube proceeding from the gas-generating apparatus is inserted beneath the mouth of the jar, so that the gas may rise in bubbles through the liquid, displace it, and so fill the vessel with gas. Gases are absorbed by liquids in some cases, the gas forming a chemical compound with the liquid, in other cases the gas has no chemical action on the liquid. Generally the amount of gas absorbed in the latter case decreases with increase of temperature, and the weight of gas absorbed varies directly as the pressure. Charcoal has the property of absorbing many gases, especially ammonia, hydrochloric acid, sulphuretted hydrogen, and sulphurous acid. The specific gravities of elementary bodies in the gaseous state, are for the most part in the same ratio as their atomic weights, but the specific gravities of phosphorus and arsenic are twice as heavy, and mercury and cadmium only half as heavy as their atomic weights. The specific gravity of any compound gas or vapor, referred to hydrogen as unity, is equal to half its molecular weight.

2. *Comm.*: The gas of commerce is carburetted hydrogen (CH₄). Its frequent disengagement in coal mines with resultant explosions, generally fatal to many lives, has caused the miners to give it the name of "fire-damp." In parts of the world it issues from crevices or holes in the strata in so moderate and continuous a stream, as to burn with a huge jet instead of exploding. This phenomenon is seen in China, in Baku on the Caspian, where a fire temple is reared with officiating priests of the Parsee faith, who regard the flame as a symbol of the divinity. It has recently been discovered in this country, and is known as Natural Gas. Gas wells abound in Ohio, Indiana, Pennsylvania, and Southern Illinois. This natural gas serves the purposes of illuminating and heating; it is coming more and more into common use. It is conveyed in pipes from the wells to several large cities, including Pittsburg, Toledo, Detroit, Indianapolis, Chicago, etc. The ignition of carburetted hydrogen may be seen in any coal fire. It has recently been discovered that giant jets of apparently similar gas flames exist in the sun, and are one main source of its light and heat.

The manufacture of gas is not difficult. Only two processes are required; to make or evolve it through the distillation of coal, and then to purify it from tar, ammonia, and sulphur. The chief series of apparatus required for these purposes are the Gas-retort, the Gas-condenser, the Gas-washer, and the Gas-purifier.

B. *As adj.*: In any way pertaining or relating to or worked by gas.

Eight or ten gallons of ammoniacal liquor are extracted from the gas produced from 2,000 pounds of coal, and it is treated by manufacturing chemists, who extract about fourteen ounces of sulphate of ammonia from one gallon of the liquor. A larger yield of ammonia is obtained by adding a small quantity of lime to the coal before it is distilled.

gas-main, s. A principal gas-pipe leading from the works, and having branches and distributing pipes. Gas mains are laid in sections, the small end of one entering the wide socket of the adjacent section. A packing of hemp dipped in tar is driven in to form a joint; over this is a luting of clay, within which is poured hot lead. The mains are laid with a gradual slope, and at the foot of each incline, or where two descending slopes meet, a reservoir is formed to collect water of condensation. This chamber has an iron cover into which is fixed a pipe, which descends nearly to the bottom of the reservoir. At the summit of the pipe is a screw, which admits the attachment of a pump, by which the liquid in the reservoir is removed.

gas-meter, s. A machine for measuring the quantity of gas passing through it. Citizen Seguin described a gas-meter at the sitting of the National Institute of France, on October 6, 1797. The wet-meter was invented by Clegg, in 1807, and improved by Croxley in 1815. The dry-meter was invented by Malam in 1820, and improved by Defries in 1838. Many improvements and variations have been added since.

An ordinary pressure during the day is $\frac{1}{2}$ of an inch; that is a pressure which will raise a column of water in a tube to that height. At night the pressure is increased according to the hour and the season; the quantity burnt in winter is double that consumed in summer; more gas is burning at 9 P. M. than at 12 P. M.; and more at the latter hour than at 3 A. M.

When the larva is mature it is excreted, and makes its final transformation in the earth or in dung.

gās-tēr-ō-pōd, s. [GASTEROPODA.] One of the Gasteropoda.

gās-tēr-ōp-ō-dæ, s. pl. [Pref. *gastero-* (q. v.); Gr. *pous* (genit. *podos*)=a foot, and Lat. neut. pl. suff. *-a*.]

1. *Zool.*: Gasteropods. The most typical, though not the most highly-organized class of the sub-kingdom Mollusca. Its essential character is that the under side of the body constitutes a single muscular foot, on which the animal creeps or glides. Most of the Gasteropoda have univalve shells, a few have them tubular or conical; in one the shell is multi-valve, and in some it is internal or wanting. Most of the spiral shells are dextral, a few are sinistral. Some have an operculum closing the aperture of the shell. The animal has a head furnished with two, four, or six tentacles, or these are wholly wanting. There is a mantle, in the folds of which the shell is produced. Some breathe air, the others water. Cuvier divided the Gasteropoda into eight orders, (1) Pectenibranchiata, (2) Scutibranchiata, (3) Cyclobranchiata, (4) Tabulibranchiata, (5) Pulmonata, (6) Tectibranchiata, (7) Inferobranchiata, and (8) Nudibranchiata. Woodward and others have divided the class into four orders only. (1) Prosobranchiata, including the first four of Cuvier's orders, (2) Pulmonata, corresponding to his 5th, (3) Opisthobranchiata, comprehending his 6th, 7th, and 8th orders; and (4) Nucleobranchiata, which Cuvier had made a distinct class—Heteropoda (q. v.). The Prosobranchiata have been arranged in two divisions: Siphonostomata and Holostomata; and the Opisthobranchiata also in two: Tectibranchiata and Nudibranchiata.

2. *Palæont.*: Gasteropoda are found in all the formations from the Upper Cambrian rocks till now. Mr. Robert Etheridge, Palæontologist, estimated the known Gasteropoda (excluding Pteropoda) from the Palæozoic rocks: at 96 from the Silurian, 0 from the Old Red Sandstone, 46 from the Devonian, 7 common to the Devonian and the Carboniferous, 174 from the Carboniferous beds, and 25 from the Permian. Of the Pteropoda there were 27 Silurian and 1 Devonian. The Holostomata are more abundant in the Palæozoic period, and the Siphonostomata in the Secondary and Tertiary strata. The Pulmonata, from being many of them land animals, are less fully represented: the Nudibranchiata, from the absence of the shell, not at all. Both families of the Nucleobranchiata have fossil forms.

unprotected even with scales. But these fishes have formidable defenses in the strong and sharp spines of their fins. In place of depositing their spawn and leaving the young fry when hatched to cater for themselves as best they can, the male stickleback constructs a nest formed of vegetable matter, within which his mate deposits her eggs. These he defends with great courage and tenacity, attempting with his spines to rip up any fish which approaches the nest.

The gastric juice also contains a free acid, probably hydrochloric acid, and a peculiar substance called pepsine (q. v.), to which, and the presence of the free acid, the power of digesting food possessed by the gastric juice appears to be due. An artificial gastric juice can be formed by extracting pepsine from the coats of the stomach by means of glycerine, and adding to the filtered liquid an aqueous solution containing 0.1 per cent. of hydrochloric acid.

Zool.: A kind of antelope, *Gazella dorcas*, formerly called *Antilope dorcas*. *Dorcas* is Latin, from Greek *dorkas*, which is from *dedorka*, the perfect tense of *derkomai*=to look, to see, with reference to the large bright eyes of the animal. From this characteristic, and its general gracefulness, it was sometimes used for a Greek female name, as in the case of *Dorcas*, who made garments for the poor (Acts ix. 36-end). The horns are rounded, thick, and black; the hair on the body light yellow on the back, while on the lower parts a broad band exists along each flank, a bunch of hairs on each knee, and a deep pouch at each groin. It lives in North Africa, is gentle in character, but when a herd is attacked, it forms a circle presenting an array of horns, so as to leave no safe means to allow the assailant to break the ring of defense. Nevertheless, the gazelle is largely preyed on by the lion. It furnishes a constant theme for Arabic poetry.
